

## **ABSTRACT :**

Adenoidectomy is a common procedure done for various causes like chronic adenoiditis or chronic adenotonsillitis or adenoid hypertrophy with middle ear and sinus disorders. Clinical features includes rhinorrhea, chronic mouth breathing, excessive snoring , apneic episodes, enuresis, daytime somnolence, neurocognitive and learning problems. Adenoidectomy provides a symptomatic recovery with improvement in the quality of life and health status of the patients. In this study we discussed on **COMPARATIVE STUDY BETWEEN CONVENTIONAL ADENOID CURETTAGE AND ENDOSCOPIC ASSISTED ADENOID CURETTAGE**. The results we obtained suggested that the endoscopic assisted adenoid curettage is comparatively better in the post operative tissue remnant, Eustachian tube injury, symptomatic relief.
