

**“AN ANALYSIS OF IUCD REMOVAL UNDER ANAESTHESIA IN A  
TERTIARY CARE CENTRE – A COMBINED RETROSPECTIVE AND  
PROSPECTIVE STUDY”**

This dissertation submitted to

The Tamil Nadu Dr. M.G.R Medical University in  
partial fulfilment of the requirement for the award of

MS BRANCH II

OBSTETRICS AND GYNAECOLOGY

REGISTER NO.: 221916869

**DEPARTMENT OF OBSTETRICS AND GYNAECOLOGY**

**MADRAS MEDICAL COLLEGE**

**CHENNAI - 600003**

**MAY 2022**

## **CERTIFICATE**

This is to certify that this dissertation titled — **“AN ANALYSIS OF IUCD REMOVAL UNDER ANAESTHESIA IN A TERTIARY CARE CENTRE – A COMBINED RETROSPECTIVE AND PROSPECTIVE STUDY”** is a bonafide work of DR.K.KAVITHA, and has been prepared under my guidance, in partial fulfillment of regulations of The Tamilnadu Dr. M.G.R. Medical University, for the award of M.S. Degree in Obstetrics and Gynecology during the year 2019 - 2022.

**ASSOCIATE PROF DR.J.SRIMATHI, MD , DGO**  
ASSOCIATE PROFESSOR  
INSTITUTE OF  
OBSTETRICS AND GYNECOLOGY,  
MADRAS MEDICAL COLLEGE,  
CHENNAI– 600008

**PROF DR. VIJAYA, MD, DGO**  
DIRECTOR AND PROFESSOR  
INSTITUTE OF  
OBSTETRICS AND GYNECOLOGY  
MADRAS MEDICAL COLLEGE,  
CHENNAI– 600008

Prof. **DR. E.THERANIRAJAN, MD.,DCH.,MRCPCH(UK).,FRCPCH(UK)**

Dean

Madras Medical College, Chennai

## ACKNOWLEDGEMENT

On completion of this contribution of scientific document it gives me deep pleasure to acknowledge the guidance provided by my distinguished mentors.

With privilege and respect I like to express my gratitude to my guide, **ASSOCIATE PROFESSOR DR.J.SRIMATHI, MD., D.G.O.**, Professor, Department of Obstetrics & Gynaecology, **Institute of Obstetrics and Gynaecology, Madras Medical College & Government General Hospital, Chennai** for her constant support & guidance in doing this study.

I am forever grateful to my **DIRECTOR AND PROFESSOR Dr. S.VIJAYA, M.D., D.G.O** , Director, Institute of Obstetrics and Gynaecology, Madras Medical College, Egmore, Chennai for her valuable support & guidance in doing this study.

I thank all my Unit Chiefs, Assistant Professors and all faculty members in Department of Obstetrics & Gynaecology for their timely advice and support.

I am thankful to **Prof. Dr.E.Theranirajan, MD.,DCH.,MRCPCH(UK),FRCPCH(UK) Dean**, Madras Medical College for permitting me to conduct this study in this esteemed Hospital and Institution.

I express my gratefulness and my gratitude to my **CO-POSTGRADUATES** who helped me immensely during the course of my study.

Last but not the least, I convey my heartfelt gratitude to all the patients participated in this study

**Dr. K.KAVITHA**

**MS OBSTETRICS AND GYNAECOLOGY ,**

**IOG , EGMORE.**

## INTRODUCTION

Since the advent of intrauterine devices, it is widely employed as a long term method of contraception. It is a popular method of contraception and a study in 1995 showed that around 106 million subjects used IUD<sup>1</sup>. The first modern devices were marketed in 1960s. They were Lippes loop and Margulies. It was synthetic and did not have any biologic interaction with the tissues. The efficacy of the device was enhanced by the use of elemental copper. This helped in reducing the overall size of the device. One major advantage of incorporation of copper was that the side effects associated with synthetic device was minimal especially bleeding and pain. However, the birth control effects were unaffected. The first generation IUDs were TCu-200, Cu-7. This device has the drawback of requiring replacement once in few years. The resultant effect was the discovery of devices like;

1. TCu-380A
2. TCu-220C
3. Nova-T
4. Multiload 375

In 1970s, IUDs that release hormones were developed<sup>2</sup>.

IUDs have the following benefits:

- The IUDs have very low failure rates compared to other techniques of reversible contraception methods.
- It is safe
- Have low risk of STI acquisition

The most commonly used is the TCu380A. It has the following features;

- a) Approved by FDA in 1994
- b) It has a life of 10-years

Studies show that IUDs have a low conception rate of 2.1% in a 10-year study<sup>3</sup>.

In spite of the success of IUD, the continuity of using this device has been under study. WHO reported that the continued use of TCu-380A in a 7-year period was 44%<sup>2</sup>. The rate of continued use was however similar to or better than other methods of contraception<sup>4,5</sup>.

This study aimed to explore the baseline demographic characteristics, reasons for IUCD removal in patients, the best period for IUCD insertion and the most suited patients for IUCD insertion.

## **AIMS AND OBJECTIVES**

Following are the aim and objectives of the study:

### **Aim**

To analyse the following;

- a) Baseline demographic characteristics
- b) Reasons for IUCD removal in patients
- c) The best period for IUCD insertion
- d) The most suited patients for IUCD insertion.

### **Objective**

To analyse the patients who came for IUCD removal under anaesthesia in the past one year

## REVIEW OF LITERATURE

### History<sup>6</sup>

Intrauterine contraceptive devices (IUCDs) are an effective, reversible and long-term method of contraception which does not require replacement for long periods and does not interfere with sexual activity. IUCDs are commonly made of polyethylene and impregnated with barium sulphate to render them radio opaque so as to render them easily detected by radiograph or ultrasound. Medicated devices which contain copper, progesterone hormone and other pharmacologic agents have also been introduced.

The history of intrauterine devices back to early 1900s. The first IUCD was developed by a German physician, Richard Richter of Waldenburg. Another German physician, Ernst Grafenberg created the first Ring IUCD made of silver filaments. A Japanese doctor named Tenrei Ota also developed a silver or gold IUD called the Precea or pressure ring.

Jack Lippes helped begin the increase of IUCD use in the United States in the late 1950s. During this time, thermoplastics which can be bent for insertion and retain their original shape became the material used for first generation IUCDs.

## Embryology and genetics<sup>7-12</sup>

The sex of a child is determined by the chromosome. There is a 23<sup>rd</sup> pair of chromosome that is inherited and the gender determining chromosome is in the father's sperm. It develops from four parts;

- a) Mesoderm
- b) Primordial germ cells
- c) Coelomic epithelium
- d) Mesenchyme

Image 1: Embryology of uterus

It is essential for a gynaecologist to understand the organogenesis of uterus.

Uterus is formed from the Mullerian organogenesis along with the cervix, fallopian tubes and vagina.

Image 2: Role of Mullerian and Wolffian ducts

## Congenital anomalies of the uterus

One of the challenges in IUD insertion is while certain aberrations from the normal anatomy.

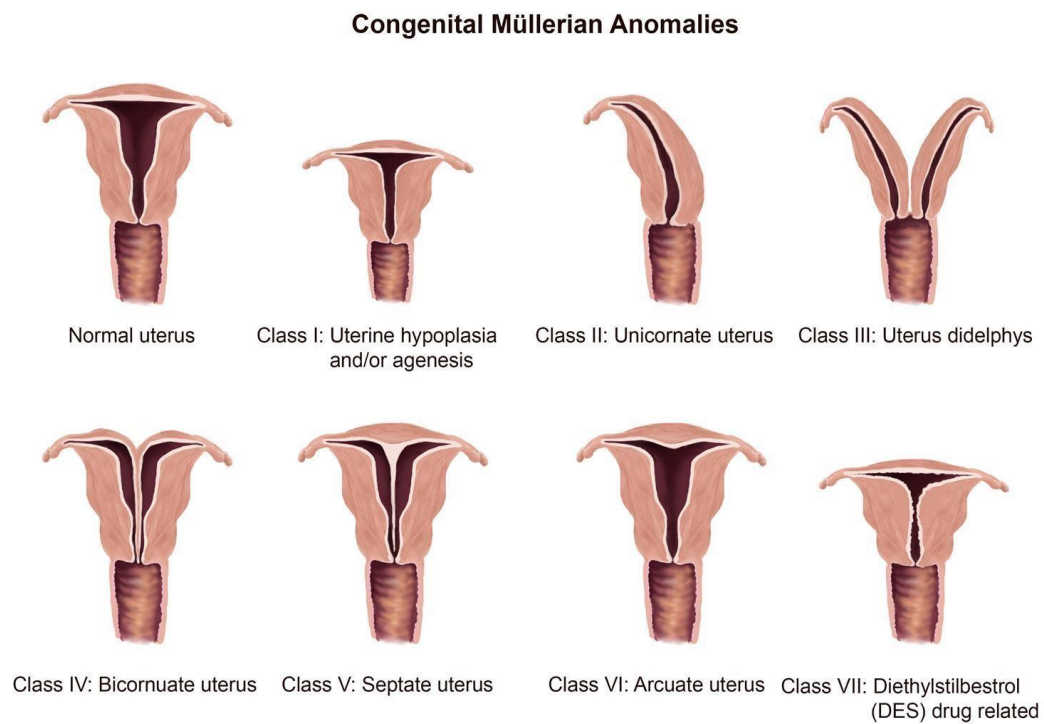

Image 3: Congenital anomalies of the uterus

The congenital anomalies of the uterus are classified into the following types given by the American fertility association:

- a) Class I: Hypoplasia/uterine hypoplasia. (Mayer Rokitansky Kuster Hauser syndrome)
- b) Class II: Unicornuate uterus
- c) Class III: Uterus didelphys.
- d) Class IV: Bicornuate uterus

- e) Class V: Septate uterus
- f) Class VI: Arcuate uterus
- g) Class VII: T-shaped uterus resulting from the exposure to Diethylstilbestrol in fetal life

It is therefore essential to test the anatomy of the uterus using an ultrasound to assess the presence of any anomalies. Better sensitivity and specificity is seen with MRI.

### Gross anatomy of uterus

Image 4: Gross anatomy of uterus

There are the following parts in the uterus;

- Uterine cavity
- Fallopian tubes
- Ovary

Image 5: Layers of the uterine wall

The uterine wall has the following layers;

- Endometrium
- Myometrium
- Perimetrium

The cells present in the endometrium and myometrium are different.

In the myometrium, there are smooth muscle fibres that help in contraction.

Endometrial glands are columnar.

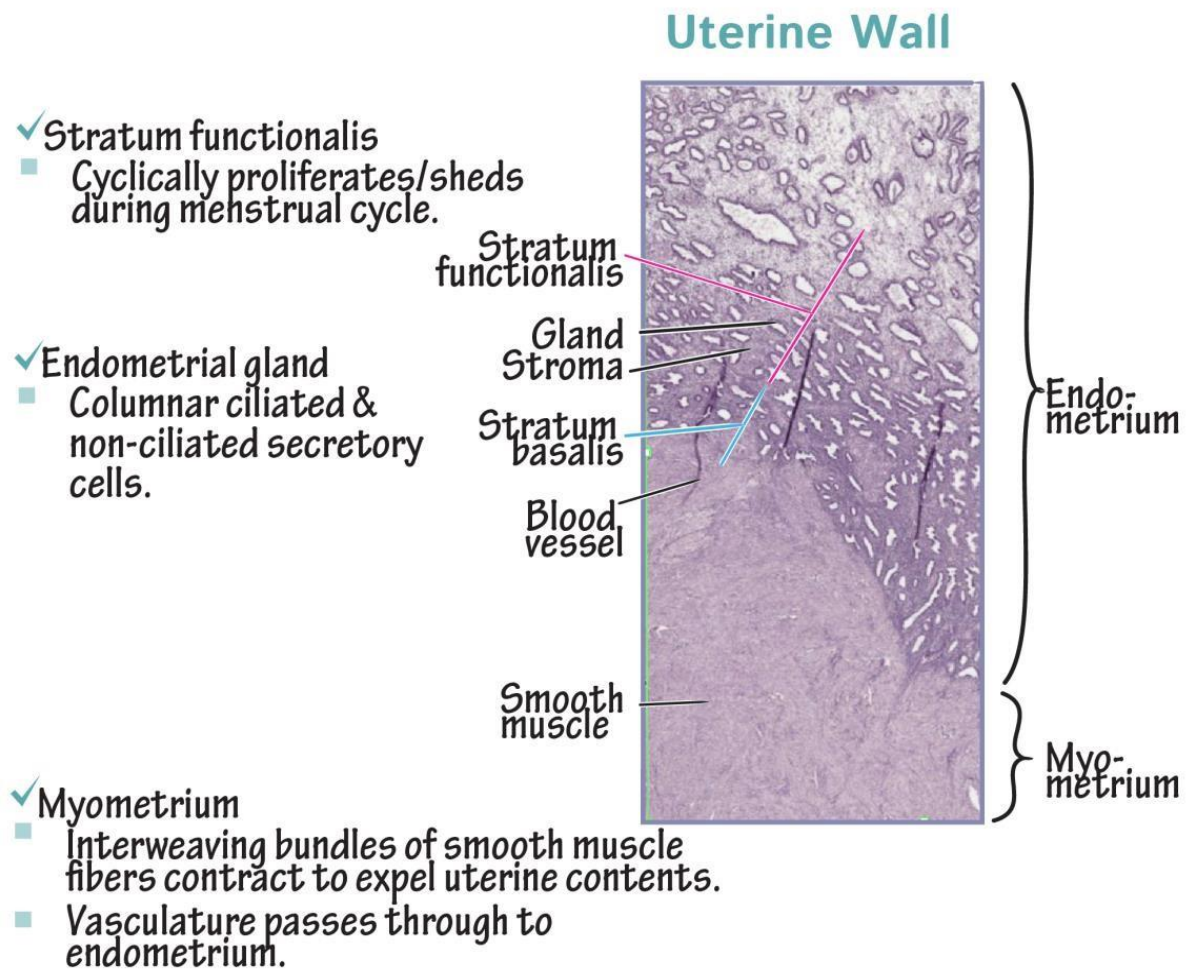

Image 6: Uterine wall

## Blood supply of the uterus

Image 7: Blood supply of the uterus

Uterus is supplied by the uterine artery and drained by corresponding veins.

## Lymphatic drainage of the uterus

Image 8: Lymphatic drainage of the uterus

The uterus is drained by the following lymph nodes;

- External iliac lymph nodes
- Internal iliac lymph nodes
- Superficial inguinal lymph nodes
- Obturator lymph node

## Nerve supply of the uterus

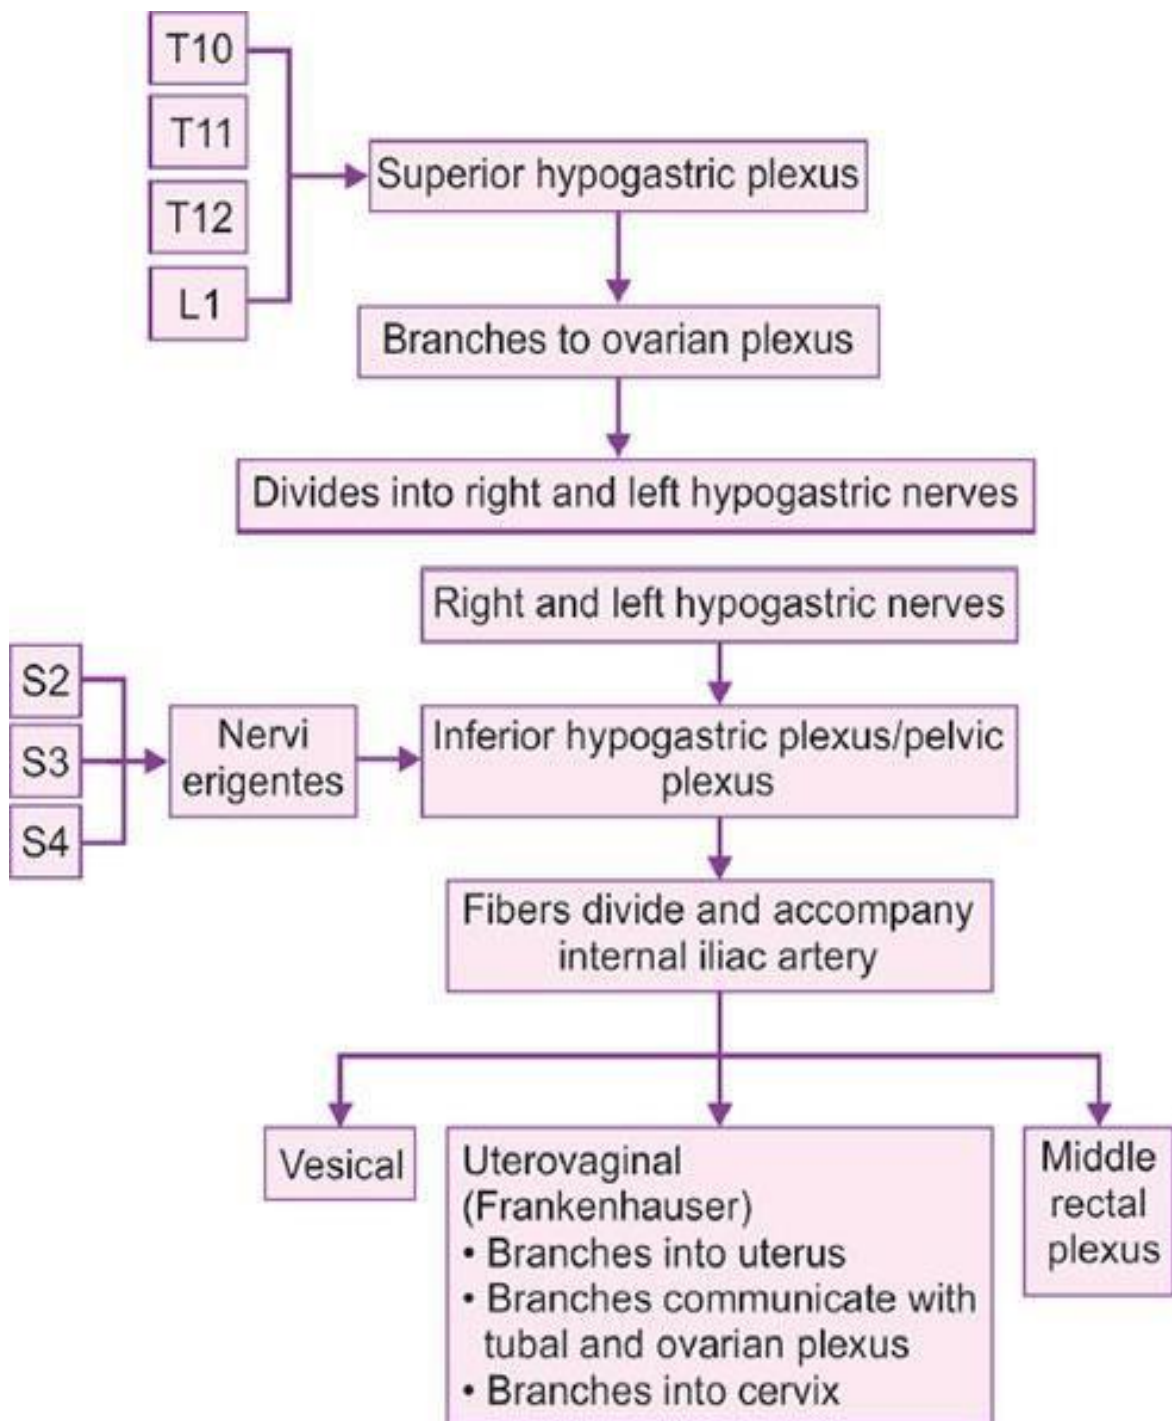

Image 9: Nerve supply of the uterus

Image 10: Normal menstrual cycle

## TYPES OF IUCDs:

There are four types of IUD used

- First generation
- Second generation
- Third generation
- Fourth generation

"Intrauterine devices and the contraceptive implant should be offered routinely as safe and effective contraceptive options for nulliparous women and adolescents."  
 "The American Academy of Pediatrics and The American College of Obstetricians and Gynecologists endorse the use of LARC, including IUDs, for adolescents."

Image 11: IUCD

First generation IUCDs are those which do not release anything drug. Introduced in 1962, they were in the shape of a plastic double loop that closely fit within the uterine cavity, reducing the incidence of expulsion. They were commonly used between 1960s and 1980s.

**A. T-shaped TCu-380A copper IUD exposes copper on both the stems and the arms.**

Second generation IUCDs were introduced in the 1970s and 1980s. They have copper added to the and included NOVA T and Multiload 250.

**B. Levonorgestrel-releasing IUD is also T-shaped.**

**C. Double “S”- shaped Lippes loop IUD was commonly used in the 1960s to 1980s.**

Third generation IUCDs are commonly in use at present and include copper T 380 A, copper T 380s , Copper T 380Ag , Copper safe 300 and levonorgestrel releasing IUCD. The levonorgestrel containing IUCD is known as MIRENA which releases levonorgestrel at the rate of 20 micrograms/day.

**D. Stainless steel ring was used primarily in China before 1993.**

## Malpositioned IUD

## Types of malpositioned intrauterine devices

| <b>Malposition</b> | <b>Definition</b>   |
|--------------------|---|
| Expulsion          | Passage either partially or completely through the external cervical os         |
| Displacement       | Rotation or inferior positioning in the lower uterine segment or cervix         |
| Embedment          | Penetration of the myometrium without extension through the serosa              |
| Perforation        | Penetration through both the myometrium and the serosa, partially or completely |

**Fig. 5.**

**Incidentally detected displaced intrauterine device (IUD) in a 38-year-old female.**

A. Sagittal transvaginal sonogram demonstrates the echogenic IUD stem within the cervix. B. Axial T1-weighted magnetic resonance image shows the low-signal IUD stem within the cervix (arrows).

**Fig. 6.**

**Displaced intrauterine device (IUD) in a 23-year-old female with positive pregnancy test despite IUD.**

A. Sagittal transvaginal sonogram shows malpositioned IUD within the lower uterine segment and cervix. B. An intrauterine pregnancy is seen within the uterine fundus. C. Transverse transvaginal sonogram shows the relationship between the low-lying IUD within the cervix (arrow) and the gestational sac within the uterine fundus (arrowhead). The IUD was removed without incident. The pregnancy resulted in a normal, full-term delivery without adverse complications.

**Fig. 7.**

Displaced and embedded intrauterine device (IUD) with early pregnancy in a 24-year-old female with acute abdominal pain and positive pregnancy test.

A. Sagittal transvaginal sonogram shows the IUD stem displaced within the lower uterine segment and embedded in the posterior myometrium (arrow) and a gestational sac in the uterine fundus (asterisk). B. Zoomed in transvaginal sonogram of the gestational sac clearly shows a double decidual sac sign (between crosshairs). Rising human chorionic gonadotropin ( $\beta$ -HCG) was consistent with pregnancy, although the outcome of the pregnancy is unknown.

**Fig. 8.**

Displaced intrauterine device (IUD) with ruptured ectopic pregnancy in a 33-year-old female having acute pelvic pain.

A. Sagittal transvaginal sonogram shows the IUD positioned almost entirely within the cervix with a complex fluid collection posterior to the cervix (arrows). B. Transverse transvaginal sonogram demonstrates internal complexity within the fluid collection, posterior to the IUD positioned within the cervix (arrow). The left ovary was not identified, and computed tomography (CT) was recommended for further evaluation. The pregnancy status was not known at the time. C, D. Axial (C) and (D) sagittal CT show a large amount of hemoperitoneum surrounding the uterus (U) and a complex structure in the left adnexa (asterisk). Human chorionic gonadotropin ( $\beta$ -HCG) level was 595 mIU/mL (normal, <3.0 mIU/mL), and the patient underwent emergent laparoscopy for ruptured tubal ectopic pregnancy.

Despite having many advantages, IUCDs may get impacted necessitating removal of the same. Also, some women might experience intolerable side effects and may seek the doctor for removal. The removal is based on the visibility of string during speculum examination. In cases where the string is not visible, hysteroscopic removal becomes necessary.

### Removal of IUD algorithm

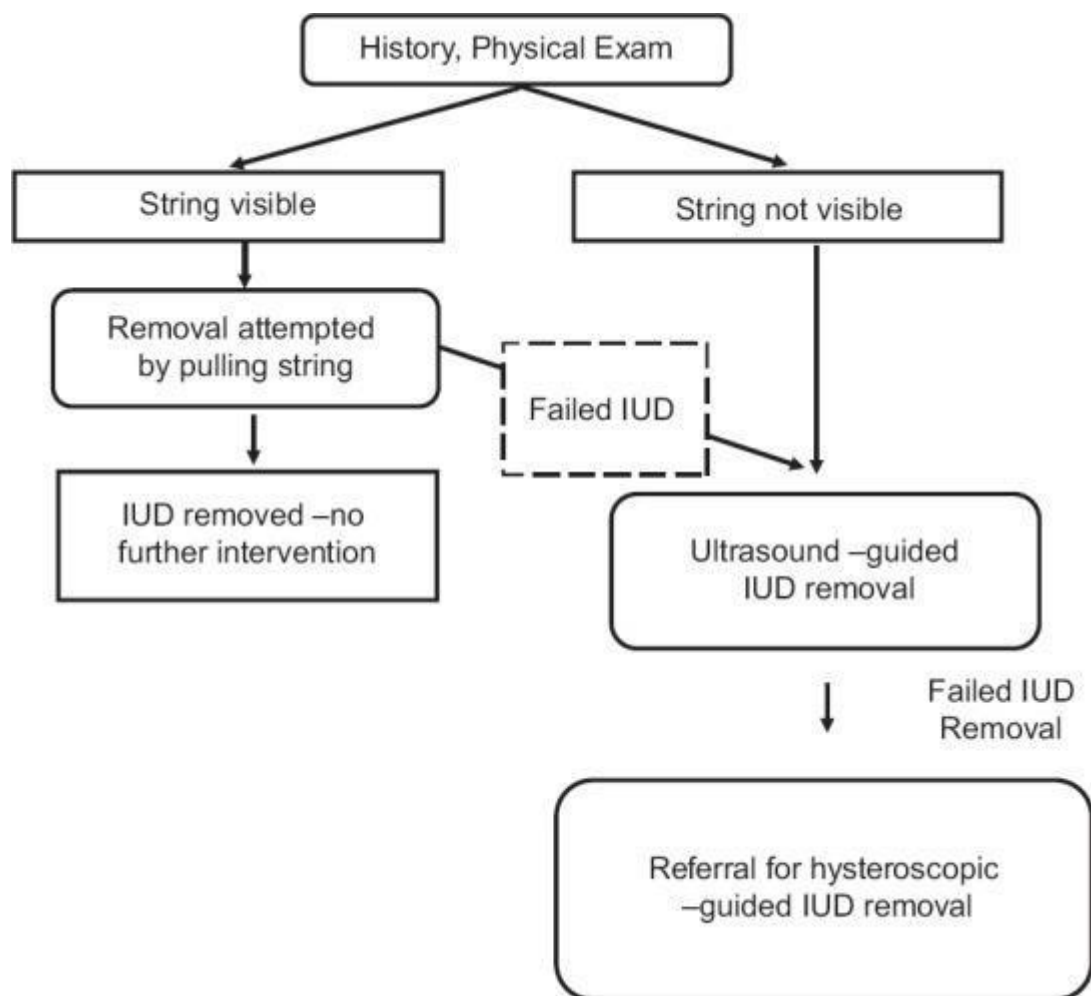

Image 19: IUD removal algorithm

## HYSTEROSCOPY:

The development of hysteroscopy dates back to 1869. Philipp Bozzini developed the technique to visualize the cavities inside the human body.

A hysteroscopy is a device used to visualize the uterine cavity and endocervical canal, and it comprises an endoscope that carries optical and light channels for insufflation of the uterine cavity which helps to visualize the uterine cavity.

It consists of a sheath, camera, telescope with eyepiece, barrel and an objective lens. The sheaths are of two types – diagnostic sheath and operative sheath. Both of them allow space for telescope and medium except that the operative sheath will have bigger diameter than the diagnostic one thereby allowing space for inserting operative devices. Operative devices are resectoscope, alligator grasping forceps, biopsy forceps, scissors, morcellator, monopolar and bipolar electrodes.

### **Relevant literature**

There are not many studies in India that have explored the reasons specifically from the clinical perspective. There are epidemiological

studies that have documented the removal with no specific insight into the mean duration of use of the device or the reason for removal.

There is a study from Turkey by Tugrul et al in 2004 that has similar objectives as the present study.

The findings from the study are graphically presented below.

| Method of IUD removal                         |                |      |
|---|----------------|------|
| Method  | <i>n</i> = 321 | %    |
| With ring forceps                             | 263            | 81.9 |
| IUD string in the cervical canal <sup>a</sup> | 7              | 2.2  |
| IUD string broken                             | 7              | 2.2  |
| With alligator forceps <sup>b</sup>           | 44             | 13.7 |

<sup>a</sup> String not visualized but found in the cervical canal.

<sup>b</sup> Use of alligator forceps due to no string.

Reasons for IUD removal

| Reason                            | <i>n</i> = 321 | %    |
|-----------------------------------|----------------|------|
| No visible strings                | 33             | 10.3 |
| No identifiable cause             | 41             | 12.8 |
| IUD + pregnancy                   | 16             | 5.0  |
| IUD related complaints            | 50             | 15.6 |
| Expired date of use               | 55             | 17.1 |
| Dislocation                       | 31             | 9.7  |

## **MATERIAL AND METHODS**

### **STUDY PARTICIPANTS:**

Patients planned for IUCD removal under anaesthesia.

### **INCLUSION CRITERIA:**

Patients with history of IUCD insertion who has now come for removal

- without visible threads and
- those with visible threads where other methods of retrieval has been failed
- With confirmed evidence of IUCD by either ultrasound / x ray.

### **EXCLUSION CRITERIA:**

Patients with history of IUCD insertion with ultrasound / x ray confirmed evidence of expulsion.

### **NUMBER OF GROUPS STUDIED:**

Single group

### **SAMPLING:**

Convenience sampling

**POPULATION:**

Patients with history of IUCD insertion who has now come for removal

- without visible threads and
- those with visible threads where other methods of retrieval has been failed

**SAMPLE SIZE: 62****METHOD OF STUDY:**

This study focuses on the need for removal of IUCD under anaesthesia and analyse them on the basis of

- The chief complaints of patients requiring IUCD removal
- Baseline demographic characters which includes age , parity , BMI, duration of IUCD use , type of delivery – labor natural / LSCS (elective or emergency ) , time of insertion of IUCD
- The type of surgical method used – removal using hook or hysteroscopic or laparotomy or other method.
- To calculate the total operative time , type of IUCD removed , operative findings , any other associated complications , problems involved in removal

## **DATA COLLECTION, ANALYSIS AND INTERPRETATION**

- 1) All data was collected in semi structured questionnaires
- 2) They were cleaned and managed in Microsoft excel
- 3) Missing values were not imputed
- 4) All data was consolidated
- 5) Data was analysed using IBM SPSS v16
- 6) Frequency and percentage analyses were done

## OBSERVATION AND RESULTS

The mean age of the participants is 29 years (S.D=4.3 years) ranging between 22 and 46 years.

The mean BMI of the participants is 24.5 (S.D=2.6) ranging between 20 and 32.

Majority of them (n=30, 48.4%) were P1L1. Majority of them had pain (n=30, 48.4%) as the chief complaint followed by AUB/Spotting P/V (n=17, 27.4%).

Majority of them were previous LSCS/LCB 3 years (n=13, 21%) followed by previous LSCS/LCB 4 years (n=10, 16.1%). Out of 62 patients, only one of them had type-2 diabetes mellitus.

Examination findings showed that per abdomen was soft in all cases, cut thread not visible in per speculum examination and cut thread not felt in per vaginum examination in all cases.

Type of anaesthesia given is spinal in 61.3% (n=38) of the cases and intravenous sedation in 38.7% (n=24) of the cases.

Hook was used for removal of IUD in 79% (n=49) of the cases while hysteroscopy was used in 21% (n=13) of the cases.

The mean duration of IUD use was 3.9 years (S.D=2.1 years).

The minimum duration was one year while the maximum duration was 10 years. The median duration was 3 years.

Out of 49 subjects on whom hook was used, 27 of them had spinal anesthesia and the rest had intravenous sedation.

The mean duration of IUD use with reason of removal showed that in patients with abnormal uterine bleeding, it is 4.18 years (S.D=2.6 years).

The mean duration of IUD use with reason of removal showed that in patients with pain, it is 4.3 years (S.D=2.1 years).

The mean duration of IUD use with reason of removal showed that in patients who wanted/wants to conceive, it is 2.8 years (S.D=1 year).

### Age distribution of the participants

The mean age of the participants is 29 years (S.D=4.3 years) ranging between 22 and 46 years.

| Parameter      | Age (In Years) |
|----------------|----------------|
| Mean           | 29.000         |
| Median         | 28.000         |
| Std. Deviation | 4.2619         |
| Minimum        | 22.0           |
| Maximum        | 46.0           |

Table 1: Age distribution of the participants

Figure 1: Age distribution of the participants

### **BMI distribution of the participants**

The mean BMI of the participants is 24.5 (S.D=2.6) ranging between 20 and 32.

| Parameter      | BMI    |
|----------------|--------|
| Mean           | 24.565 |
| Median         | 24.000 |
| Std. Deviation | 2.5663 |
| Minimum        | 20.0   |
| Maximum        | 32.0   |

Table 2: BMI distribution of the participants

Figure 2: BMI distribution of the participants **Obstetric Score of the participants**

The following table shows the obstetric score of the participants. Majority of them (n=30, 48.4%) were P1L1.

| <b>OBSTETRIC SCORE</b> | Frequency | Percent |
|------------------------|-----------|---------|
| P1L1                   | 30        | 48.4    |

|        |    |       |
|--------|----|-------|
| P1L1A1 | 7  | 11.3  |
| P2L2   | 21 | 33.9  |
| P2L2A1 | 3  | 4.8   |
| P3I2   | 1  | 1.6   |
| Total  | 62 | 100.0 |

Table 3: Obstetric Score of the participants

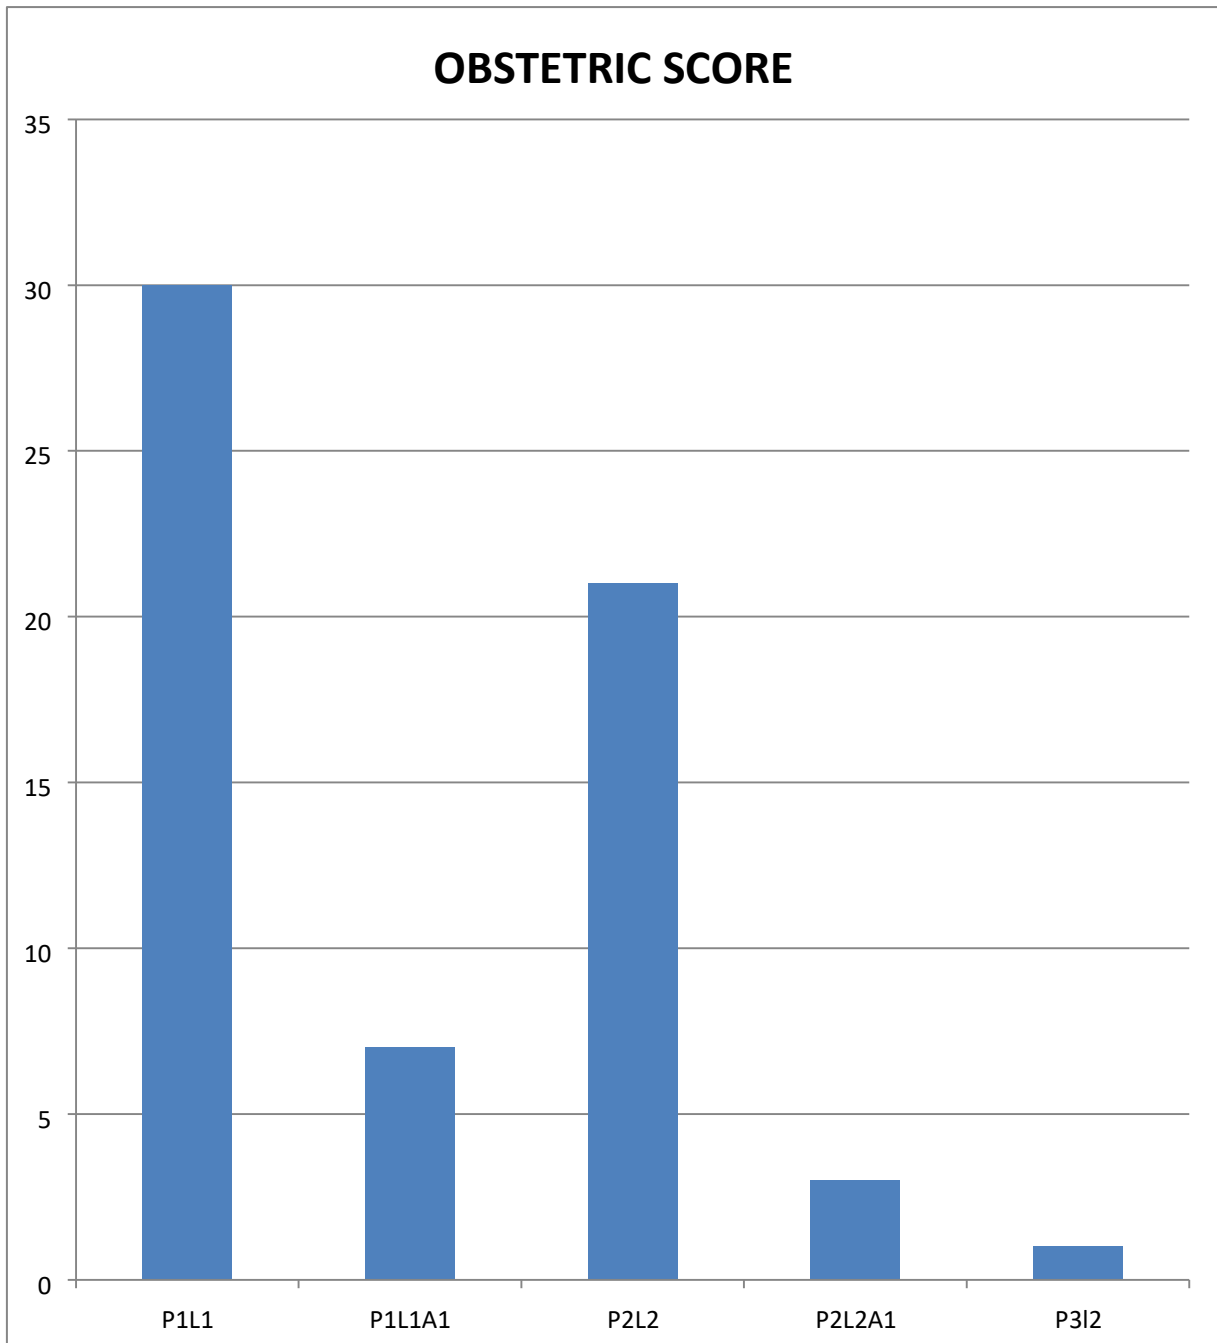

Figure 3: Obstetric Score of the participants **Reasons for removal**

Majority of them had pain (n=30, 48.4%) as the chief complaint followed by AUB/Spotting P/V (n=17, 27.4%).

| <b>Reasons for removal</b> |   | <b>Frequency</b> | <b>Percent</b> |
|----------------------------|---|------------------|----------------|
|                            | Abnormal Uterine<br>Bleeding/ Spotting per<br>vaginum | 17               | 27.4           |
|                            | Pain  | 30               | 48.4           |
|                            | Wants/ Wanted To<br>Conceive                          | 15               | 24.2           |
|                            | Total   | 62               | 100.0          |

Table 4: Reasons for removal

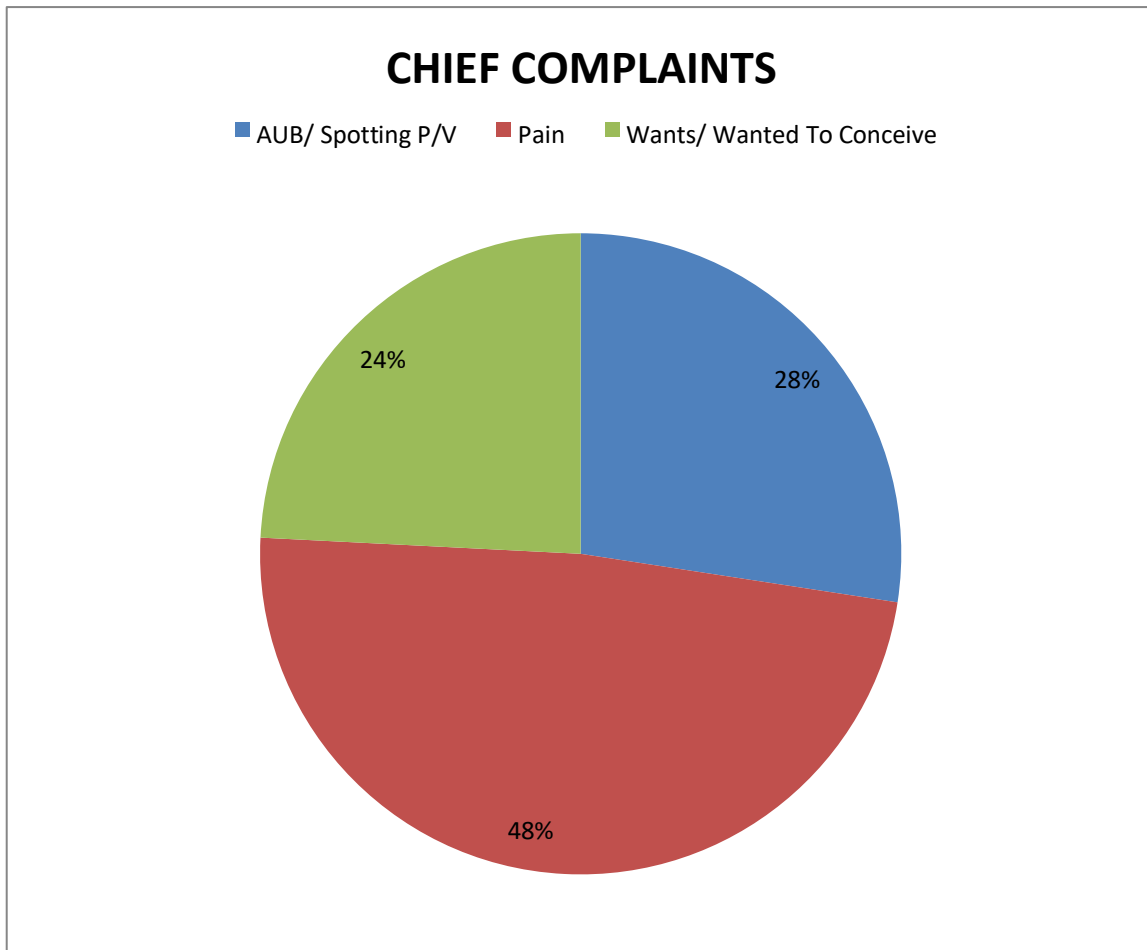

Figure 4: Reasons for removal **Obstetric history of the participants**

Majority of them were previous LSCS/LCB 3 years (n=13, 21%) followed by previous LSCS/LCB 4 years (n=10, 16.1%).

| <b>OBSTETRIC HISTORY</b> |                             | <b>Frequency</b> | <b>Percent</b> |

| Total               |            | 49             | 13           | 62    |

Table 11: Comparison of removal method with type of anesthesia used

Figure 11: Comparison of removal method with type of anesthesia used  
**Duration of IUD use in different reasons for removal**

The mean duration of IUD use with reason of removal showed that in patients with abnormal uterine bleeding, it is 4.18 years (S.D=2.6 years).

The mean duration of IUD use with reason of removal showed that in

patients with pain, it is 4.3 years (S.D=2.1 years).

The mean duration of IUD use with reason of removal showed that in patients who wanted/wants to conceive, it is 2.8 years (S.D=1 year).

| Duration of IUD use in different reasons for removal |       |    |                |
|--|-------|----|----------------|
| Reasons for removal                                  | Mean  | N  | Std. Deviation |
| Abnormal Uterine Bleeding                            | 4.179 | 17 | 2.65           |
| Pain   | 4.383 | 30 | 2.12           |
| Wanted/wants to conceive                             | 2.833 | 15 | .99            |
| Total  | 3.960 | 62 | 2.07           |

Table 12: Duration of IUD use in different reasons for removal

Figure 12: Duration of IUD use in different reasons for removal  
**DISCUSSION**

The mean age of the participants in 29 years (S.D=4.3 years) ranging between 22 and 46 years. This is similar to the study by Tugrul et al in 2005 that had a similar distribution of age.

The mean BMI of the participants is 24.5 (S.D=2.6) ranging between 20 and 32. None of them were extremely obese in this study.

Majority of them (n=30, 48.4%) were P1L1. This shows the reason for removal of IUD as most of them wanted to conceive in this category. However, pain and bleeding was the most common reason in women who had completed their families.

Majority of them had pain (n=30, 48.4%) as the chief complaint followed by AUB/Spotting P/V (n=17, 27.4%). Majority of them were previous LSCS/LCB 3 years (n=13, 21%) followed by previous LSCS/LCB 4 years (n=10, 16.1%). Out of 62 patients, only one of them had type-2 diabetes mellitus.

Examination findings showed that per abdomen was soft in all cases, cut thread not visible in per speculum examination and cut thread not felt in per vaginum examination in all cases. Type of anaesthesia given is spinal in 61.3% (n=38) of the cases and intravenous sedation in 38.7% (n=24) of the cases.

Hook was used for removal of IUD in 79% (n=49) of the cases while hysteroscopy was used in 21% (n=13) of the cases.

One of the major finding in this study is the mean duration of IUD use. The mean duration of IUD use was 3.9 years (S.D=2.1 years). The minimum duration was one year while the maximum duration was 10 years. The median duration was 3 years. Out of 49 subjects on whom hook was used, 27 of them had spinal anesthesia and the rest had intravenous sedation.

The mean duration of IUD use with reason of removal showed that in patients with abnormal uterine bleeding, it is 4.18 years (S.D=2.6 years).

The mean duration of IUD use with reason of removal showed that in patients with pain, it is 4.3 years (S.D=2.1 years). The mean duration of IUD use with reason of removal showed that in patients who wanted/wants to conceive, it is 2.8 years (S.D=1 year).

All these findings are similar to the study by Tugrul et al (2005) and the study by Cheung in 2009.

## SUMMARY AND CONCLUSION

### Summary

The mean age of the participants is 29 years (S.D=4.3 years).

Majority of them (n=30, 48.4%) were P1L1

Majority of them had pain (n=30, 48.4%) as the main reason for removal followed AUB/Spotting P/V (n=17, 27.4%).

Hook was used for removal of IUD in 79% (n=49) of the cases while hysteroscopy was used in 21% (n=13) of the cases. Cut 375A was the IUD removed in all cases.

The mean duration of IUD use was 3.9 years (S.D=2.1 years). The minimum duration was one year while the maximum duration was 10 years. The median duration was 3 years.

The mean duration of IUD use with reason of removal showed that in patients with abnormal uterine bleeding, it is 4.18 years (S.D=2.6 years).

The mean duration of IUD use with reason of removal showed that in patients with pain, it is 4.3 years (S.D=2.1 years).

The mean duration of IUD use with reason of removal showed that in patients who wanted/wants to conceive, it is 2.8 years (S.D=1 year).

### **Conclusion**

The incidence of removal of IUD is low with only 62 subjects reporting during the study period

The major reason for removal of IUD is pain followed by abnormal uterine bleeding

The mean duration of IUD use was 3.9 yrs

From this study we can observe

That previous caesarian section has got more risk of getting impacted than previous Normal vaginal delivery. The patients with previous caesarian section with IUCD has to be kept in regular follow up for the presence of thread. They have to be followed up in the same institute where they delivered atleast till the postpartum period and for every three months thereafter.

In Institute of obstetrics and gynaecology during the one-year study period a total of 349 cases of IUCD were removed in total out which 287 were removed in OPD and 62 were removed using anaesthesia ,which calculates

to a percentage of 18. This shows that though intrauterine contraception is one of the effective method of contraception , a significant amount of candidates are going for impaction of it and being subjected to anaesthesia which adds to the morbidity .

It should be ensured that thread is directed well into the cervical os especially when LSCS is done in patients not in labour . insertion can be done using hands than using insertors to avoid the risk of IUCD getting impacted.

The final idea is to keep the candidates of IUCD in regular monitoring especially in the same institute where they delivered to avoid the risk of subjecting them to anaesthesia in future.
