A STUDY ON
CEGANA VATHAM

Dissertation Submitted To
THE TAMIL NADU DR.M.G.R Medical University
Chennai – 32

For the Partial fulfillment for The Award of Degree of
DOCTOR OF MEDICINE (SIDDHA)
(Branch – III, SIRAPPU MARUTHUVAM)

DEPARTMENT OF SIRAPPU MARUTHUVAM
GOVERNMENT SIDDHA MEDICAL COLLEGE
PALAYAMKOTTAI – 627 002
MARCH - 2009
ACKNOWLEDGEMENT

First of all I am extremely grateful to my Lord Almighty who empowered with his blessings and strengthening me to reach the milestone successfully.

I bend my head with melliflows thanks to my parents.

I take this opportunity to express my gratitude and acknowledgement to The Vice Chancellor, The TamilNadu Dr. M.G.R. Medical University, and The Special Commissioner, Indian medicine and Homeopathy Department - Chennai for permitting me to undertake this dissertation work.

I express my deep sense of gratitude to our Principal Dr. R. Devarajan M.D(S)., Government Siddha Medical College, Palayamkottai for his auspicious support in bringing out the dissertation and I also thank our Vice Principal Dr. S. Soundararajan M.D(S)., for his support regarding this study.

It is my pleasure to express my grateful thanks to Dr. R. Janarthanan M.D(S)., Head of the Department, PG- Sirappu Maruthuvam department for his support to do this study.

I feel very proud to record my deep sense of thanks to Dr. K. Somasekaran B.Sc., M.D(S)., Previous Head of the Department.

I express my wholeheartly thanks to Dr. S. Kaniraja M.D(S)., Lecturer and Dr. D. Rajasekar M.D(S)., Asst. Lecturer and Dr. K. Saibudeen M.D(S)., Former Asst. Lecturer – PG Sirappu Maruthuvam for rendering their valuable suggestion, guidance and support for my dissertation work.
I express my cordial thanks to Dr. A. Kumar M.D(S)., Head of the Aruvai Maruthuvam Department, Dr. R. Sankaranarayanan M.D(S)., and Dr. V. Muthukumar M.D(S)., Asst. Lecturers, Aruvai Maruthuvam Department for their kind help to do this study.

It's my pleasure to express my sincere thanks to Dr. S. Ramaguru B.Sc., M.S (Ortho), Prof. of Orthopaedics, Tirunelveli Medical College, Palayamkottai, for his valuable guidance for this study.

My sincere thanks to Mr. K. Kalaivanan M.Sc., Lecturer, Department of Pharmacology and I also thank Prof. Mrs. L. Nagaprema M.Sc., M. Phil., Head of the Biochemistry Department., & all other technical experts for their help in laboratory studies.

The author expresses his gratitude to Dr. S. Baheerathi M.B.B.S., M.D., and all technicians of Clinical Pathology Department for giving a kind co-operation in doing investigation procedures and in clinical studies.

I extend my faithfulness to Librarian, Mrs. Poonkodi B.Lib.Sc., Govt. Siddha Medical College, Palayamkottai who helped for the reference of this dissertation work.

It is my duty to express my cheerful thanks to my Family members for their unvarying pleasant encouragement during the whole study period.

It's very pleasure to express my exquisite gratitude to my Beloved Friends for their help and encouragement to complete this work.

My sincere thanks to Broad Bank Net Café (BBNC) Palayamkottai for their co-operation in bringing out this dissertation work in full fledged manner.
INTRODUCTION

Man is the most wonderful creature of nature when discussing the issue of health, it is common for people in all cultures to talk just about their body, its ailments and the medicines they right to treat these ailments.

However health is not merely a matter of the state of the body, since it is obvious we are much more than just this material forms. A system of health that only takes into account the structure and the functioning of the physical body cannot effectively address human health is its totality siddha is not just a medical approach to health, rather it is a complete philosophy of life.

Siddha gives equal importance to the parts of life which are more objective and material, those aspects we can observe without physical senses. In fact it is a view of life which understands that the non-material components of our life, our consciousness, mind, thoughts and emotions animate and direct our more physical parts. In siddha system of medicine we can save our body from diseases and attain our soul to the “Nature”.

The siddha system of medicine is the ancient system of medicine, which has been presented by the siddhar. The unique nature of this system is its continuous service to humanity in computing diseases and in maintaining its physical, mental and moral health, while many of these contemporaries had completed their forces long ago. This system of medicine is purely scientific and peculiar complex system of science and philosophy.

Siddha provides rational methods for the treatment of many diseases, which are considered to be obstinate and incurable in other system of medicine.
Good health is considered essential for the achievement of these objectives, according to siddhars. In the process of maintaining good health, the disease, aging process and death are considered as obstacles.

The prevention and cure of illness are the basic aims of all system medicine. The siddha system has in addition to cure diseases, a transcendental motivation, and concern for what might be called the immortality of the body. The siddha philosophy admits two modes of salvation. One is salvation, after leaving behind the mortal body which is called Viedhu Mukthi. The other salvation in this life itself with the body called Jeeva Mukthi. The siddhar aimed at Jeeva Mukthi.

Saint Thirumoolar insists on attaining salvation by the following verse.

"அறப்பு சய்சுகொன்று முன்புறி லைகு
அறப்பு சய்சுகொன்று முன்புறி லைகு
அறப்பு சய்சுகொன்று முன்புறி லைகு
அறப்பு சய்சுகொன்று முன்புறி லைகு"

So, perfect health leads to a perfect mind which ultimately leads an individual to salvation or Veedu Paeru, Sariai or Physical labour, Kiriyai or ritual way, Gnanam or knowledge and Yogam are the for ways for attainment, according to siddhars. By these process the physioetheric being gets freed from the materialistic pleasures and becomes one with the supreme.

This can be inferred from the following Thirukkural.

“சாதமு தூறையானது நிகழ்த்தும் பெரிதுதலானது
ஸாதமு தூறையானது நிகழ்த்தும் பெரிதுதலானது.”

The dearrangement is basically attributes to improper food, and activities the season and normal physical constitution of a man.

Diagnostic methods of siddha system of medicine is very unique of solely based on the clinical acumen of the physician. The diagnosis is also made by eight tools of diagnosis as mentioned below.
The treatment methodology of siddha medicine is aimed to keep the three dhoshas in equilibrium for the maintenance of seven thathus. So proper diet, medicine and regimen of life are advised for a healthy living. Treatment is classified into

1. Dheva Maruthuvam - Divine Method
2. Manuda Maruthuvam - Rational Method
3. Asura Maruthuvam - Surgical Method

The line of treatment is divided into Kappu, Neekkam and Niraivu.

**Sirappu Maruthuvam:**

Sirappu Maruthuvam is a branch of medicine which deals with the bodily disorders and to increase the longevity of human lifespan by preventing diseases. It relieves mental tension and depression and gives peace.

This is achieved by following techniques.

1. Yoga and kayakalpam
2. Rejuvenation Therapy.
3. Muppu
4. Varmam thokkanam of enbu murivu
5. Kirigai and Kanma Noi
6. Dermatological disorders.

Since older days, in the treatment of vatha diseases, the siddha system of medicine has been very much popular.

The author of this dissertation work has selected “Cegana Vatham” under the vatha disease explained by lord yoogi in yoogi Munivar Vaidhya Sindhaamani Perunool - 800 and a clinical entity comparable to cervical spondylosis in modern medicine.
The author’s choice of drugs for the clinical study is

1. Kadukkai Choornam – Internal Use  
   Ref (Sarabandirar Vaidhyam)

2. Yearanda Thaylam  
   Ref (Sarabandirar Vaidhyam)

The drugs were prepared personally by the author and were tried twenty selected ceganavatham cases of various aetiology.

The clinical study was undertaken in the in patient ward of post graduate department of sirappu maruthuvam at government siddha medical college, palayamkottai. Another twenty patients were also treated with the trial drugs in the out-patient ward.

Appreciation and appropriate application of siddha science are sure give us all a happy, healthy and harmonious life.
AIM AND OBJECTIVE

The main aim of the present study is to do a clinical study on the course of the disease ceganavatham with known observation on the aetiology, pathology, diagnosis, complications and the treatmental aspects using a time honoured siddha drugs Kadukkai Choornam as on internal medicine and Yearandathylam as an external medicine.

The present study includes the following.

2. To have an idea of the incidence of the disease with reference to sex, age, habit, occupation, income, social status etc.

3. To have a clinical trial with some specific time honoured siddha drugs.

4. To ascertain the extent of correlation of aetiology, sings and symptoms of Cegana Vatham is siddha system with “Cervical spondylosis” a Clinical entity in the modern medicine.

5. To evaluate the Biochemical and pharmacological actions of the trial medicines.
LITERATURE STUDY ON SIDDHA ASPECT

The details of Cegana Vatham is delt under following headings.

DEFINITION

A kind of Neurological pain (Vatha disease) affecting the cervical vertebral region and extending to the upper limbs and is associated with heaviness of body, giddiness, burning sensation of the eyes, discharge of urine with pain (Strangury or dysuria)

AETIOLOGY

The aetiological factors, which aggrevate vatha diseases are the most common causes of Cegana vatham. These factors which are explained by various authors as follows.

a. By Yugi Vaithya Chindhamani - 800°

"Gu ] úY Y ôRkRô ú] i TRôå m

To sum up

The following intrinsic and extrinsic factors are attributed to be the causative factors for the manifestations of Vatha disease.

EXTRINSIC FACTORS

1. Exposure to dampness and cold.
2. Precipitation of the disease in the months from Aani to karthigai.
   (From June to December).
3. Sleeping during day time and working throughout night.
4. Physical strain due to excessive weight lifting.
5. Walking for a long distance, exposing the body to dampness and cold.
INTRINSIC FACTORS

1. Diet

Intake of food items which are excessive in bitter, astringent and pungent taste, intake of previous day cooked food item, drinking rain water, harmful combination like taking excessive curd after eating fruits, vegetables and tubers causes toxic factors which affects bones and muscle.

2. Psycho Social Aspects

Breach of Trust, splitting the chastity of a women, abusing the holymen and ritualists, exploiting the properties of charities, ingratitude towards mother, father and teacher, abusing the holy scripts, disregarding the divinity, refusing the food for destitutes and saints, forgetting the advise of preceptors and wickedness such as murdering, stealing, lieing, involving in immoral activities, sexual perversion, removing the bark of living tree, breaking the leg of the animals, cutting the trees, cutting the living branches and removing leaves.

Even though on the above lines our legends Siddhars explain the common causes, we cannot understand how it produces the distresses of Cegana vatham. The author denotes that all this view should be for further analysis.

Common Signs and Symptoms:

The signs and symptoms of this disease Cegana vatham were explained by Yugimuni and Pararasasekaram as follows

a. By Yugimuni

"úLð úU Lî j ³w iZú Wëá úUí e
úL³W ôj LWÀ W å Á LÚY úSökcç
Y ðö úU N-úWUp Xôm Lj j ³w dá m
Y ðÃ Todá Uj e Li æ UVdLUóám
According to Panchapootha principle when elemental composition is altered naturally uyir thathugal or the three humors, which are made up of these elements get deranged. This simultaneously lead to derangement of seven udal thathugal which produce symptoms. This is one way of pathology, producing Cegana vatham.

Another theory which explains as follows, the etiological factors of Cegana vatham are both diet that produce excessive vayu and other agents which cause vitation of vayu, aahayam, earth and fire, depending upon this corresponding uyir thathu is affected.

Here,

Aahayam + Air - Vatham
Earth + Water - Kabam
Fire - Pitham
So vatham, pitham and kabam are deranged. Simultaneously udalthathugal get deranged. These events give rise to clinical features of Cegana vatham.
1. EARTH ( qx m  ) : Gives shape to the body and release its energy.
   Bones, muscles and tissues represent it in the body.

2. WATER ( o ) : Makes the earth supple and helps in the transmission of energy. Serum, lymph, Saliva etc, represent it in the body.

3. FIRE ( § ) : Steadies the form of the body and gives vigour and stimulation. Digestion and circulation represent it in the body.

4. AIR ( Y Ç ) : Ignites the fire and works as a life carrier and is the support of all contact and exchange. Respiration and Nervous system represent it in the body.

5. ETHER ( A  amoë ) : Is the creater of life itself in the body.

A harmonious combination and function of these five elements in the body produce a healthy and beautiful life.
Man has gross physical body \((\text{v} \, \text{O} \, \text{X} \, \text{m})\) and subtle physical body \((\text{N} \, \text{h} \, \text{N} \, \text{U} \, \text{m})\). The subtle physical body is immediately behind the gross physical body and is closely connected with it.

Vatham = Air + Ether

In Cegana Vatham both air and ether are affected.

The life-force which is different from material energy derived from food, prevades the gross physical through the subtle physical.
Vatham : Represents Vayu, Mind, Dryness, Pain, Flatulence, sensitiveness, lightness and also air.

Pitham : Represents gastric juice, bile, energy, heat, inflammation, anger and irritation etc.

Kabam : Represents feeling of cold, heaviness, running of the nose, passing of mucoid discharge and also the saliva.

According to Theraiyar, urine should be of low density and with discoloration. In Cegana vatham, urine is yellow colour with low density.

In Cegana vatham patients during Neikuri examination the oil spreads like snake and sometimes like ring and pearl.

TREATMENT OF CEGANAVATHAM

In Siddha system the main aim of treatment is not only for the removal of physical illness but also for the mental illness. Treatment is considered with prevention and improvement of the general body condition also.

This said as follows

Lôlé - Prevention
¨dLm - Treatment
їû \î - Restoration

Lôlé

To prevent Cegana Vatham
1. Reduce the body weight by diet and exercise
2. Modify the nature of work which gives stress and strain to the neck region. Avoid prolonged writing with constant position of the neck
3. Use pillows of minimum height.
4. Avoid excessive intake of sour, astringent, salt and bitter tasted foods which increases the vatha and pitha kuttram.

DIET FOR DIABETIC AND HYPERTENSIVE PATIENTS:

- Salt free diet was advised for hypertensive patients.
- For an overweight diabetic, reduction in the number of calories is essential. Total calories should be approximately 30 cal/kg body weight.
- Simple sugars like canesugar, glucose, sweets, soft drinks, cakes, ice-cream should be avoided in day to-day diet.
- Diet should be rich in fibre content 20 to 30 gm per day
- Animal fats (saturated) ingestion should be avoided.
The aim of Noi Neekam is based on

- To bring the three dhosa in equilibrium.
- Treatment of the disease by internal medicine and external application.
- Pathiyam (ie) dietary regimen to suit the drug and the disease.
- Yoga therapy.
- Thokkanam.
- Kanma niverthy (Expiation).

The line of treatment as described as follows

1. Bring the Three Dhosas in Equilibrium:

   "ë ÎÅ½ Ùì A ê Eì ŸLôs á Él Û T
   Òl TôRÉ èm Ru û Uëm Y óRÀ j R ú Y VI
   ÀÅÚ Y ëU Ú J Y Rôm
   HÈ Â\e, C ÛQ kç LXkç
   ÛÛÊ ÛÔÊ Yì g üNñ Û LVôt À½
   úSoû UVÈkç "hâ Ùì kûR
   ËÀVRôûU] f ÙNIÉy o Ùj RÚW"

   "-ûSôn SôPp úSôn è R] ôPp Tá¾ - 1"

   since Siddha system of medicine is based on the Mukkutra theory, the treatment is mainly aimed to bring down the three dhosas to its equillibrium state and thereby restoring the physiological condition of various thathu.

   Derangement of Vatha is the prime factor for “Cegana Vatham”

   Kalichal Maruthuvam (Purgation) corrects the elevated Vatham.
The Following Verses reveals the Importance of Kalichal Maruthuvam.

“Ã úWN] j Rôp Y ôRm Rôî m”
“Kç , u \ UX dLhû P j ÆV ú Y j Rôp
E PÄ í s [ Y ôû RùV X ô ùUôå e , l úTôá m”
“A Èk¾åm Y ôRm A Pe á UX j ÷É p ”

5 gm Nilavagai chooranam with luke warm water at bed time or 15ml of vellai ennai with luke warm water was administered at early morning as a kalichal medicine in the first day of treatment.

2. Internal Medicine and External Application

Internal Medicine

Kadukkai Choornam - 1gm
- Twice a day (Morning and Night) with butter milk or honey.

External Application

Yearanda thylam After oil application for 10 minutes, patients are advised to perform the exercises, which are explained by the author in this dissertation later.

GENERAL SIDDHA TREATMENT FOR CEGANA VATHAM

We can use the following drugs also in cegana vatham.

Purgatives:

Kuzhambu

1. Agathiyar kuzhambu - 65 mg

Mathirai

1. Astabairava Mathirai - 3 to 4
2. Sanjeevi Mathirai - 2 to 4
3. Kodasoori Mathirai - 2 to 3
4. Meganatha Mathirai - 2 to 3
Thylum
1. Vellai Ennai - 10-20ml
2. Kazharchi Thylam - 10-15ml
3. Merugulli Thylam - 10-15ml
4. Vaathanasa Thylam - 15-30ml

INTERNAL MEDICINES

Kudineer
1. Nilavembu Kudineer
2. Kasakasa Kudineer
3. Amukkara Kudineer
4. Seenthil Kudineer

Choornam
1. Amukkara Choornam
2. Parangi Pattai Choornam
3. Thirikadugu Choornam

Mathirai
1. Emathanda Kuligai 1-Bd
2. Kodasoori Mathirai 1-Bd
3. Pachai Karpoora Mathirai 1-Bd
4. Vatha Ratchasana Mathirai 1-Bd
5. Vatha Madakki Mathirai 1-Bd

Chendooram
1. Gowri Chinthamani - 100mg Bd

### Kattu

Poora Kattu - 25mg Od
Linga Kattu - 25mg Od

### 3. Tj ḳv m

#### Diet Regimen

During the course of Treatment according to the nature of illness and the drug administered, the patient were advised to follow certain special dietary methods called “Pathiyam”. The importance of pathiyam is clearly mentioned by Theraiyar as follows
Proper dietetic regimen enhance the bio-availability of the drug and are conductive to the maintenance of good health. If dietetic regimen is not followed certain food may be incompatible and antagonise the drug effect and produce harmful effect to the body.

Three types of pathiyam are commonly told. They are Låm Tj ¾V m, CfNôTj ¾V m, E lÀp X ô Tj ¾V m, (salt free dieting) also mentioned in many ancient Siddha literatures especially for the mercurial preparations of drug.

**Vatha Roga Pathiyam**

"éÇ ç Y o Å g äe LÈV ôt xÄdá m Y ôRm"

ie .,Tamarind and Astringents increase vatham. So the Cegana Vatham patients were advised to avoid tamarind and astringents.

In “Pathartha Guna Chinthamani” - the following are advised to avoid

\[ \text{Låá St ÉXj ùRi ùQ n ī r Tôì Pe Ls LPû X} \]
\[ \text{Y åL Rô, V ùRe LUò Y î dû L St LöV m} \]
\[ \text{U½Ã XôR ùY s ô s ÇùLôs éû LÂ ü X Uç üTi} \]
\[ \text{CPñ TôLÚXô PLj ¾ d , PÄ f NôTj ¾V m"} \]

CfNôTj ¾V j ¾ ò dám ùTôì hL[ öY ] : 
\[ \text{Låá, Gs ùSn, LÄ VôQ} \times N½ dLôn, \text{LPû X, ùRe Lôn,} \]
\[ \text{Uôe Lôn, TX ô, LöV m, ùLôs , éû LÂ ü X, TôLp} \]
\[ \text{A Lj ¾} \]
\[ \text{ê RÄ V] .} \]
Strict Pathiyam (Lâm Tj ¾V m):

ie A small quantity of fried salt is added to cooked rice which is taken after adding hot water. Fried tamarind, unripe bringal and drumstick are taken in the form of soup along with fried salt.

Bám ùTôi hLs:

The following food materials are good for the Vatha diseases.

To expiate misneeds of Kanmam, planting trees, establishing gardens, laying roads and pathways digging wells, pools, lakes, construction of temples, donating ornaments to poor children must be done. These are advised to patient.

4. Lu U ðY øj ¾ (Expiation)

Our Siddha literature says, Poorva kanmam is one of the reasons for diseases among mankind. It should be expiated.

To expiate misneeds of Kanmam, planting trees, establishing gardens, laying roads and pathways digging wells, pools, lakes, construction of temples, donating ornaments to poor children must be done. These are advised to patient.
APPLICATION OF SPECIAL MEDICINE

Methods

All the wonders of modern science will not bring happiness, peace of mind, health or a long life. Although wonders have been achieved in our External Environment, Space, Travel, Computers etc. Our internal environment has been neglected. In the manner of rectifying this negligence and also as an immediate and preventive cure for Cegana vatham patients in our Sirappu Maruthuvam branch, the author have explained special medicine methods like Yoga, Thokkanam, Pranayamam, Exercises, Varmam and Mudra.

YOGA

Yoga is one of India’s wonderful gifts to mankind.

The word “Yoga” is derived from its Sanskrit origin “Yuj” which means to bind, to join or to apply.

Traditionally philosophers had interpreted this to read “Yoking of all powers of the body, the mind and soul to God”.

Another frequently used definition of ‘Yoga’ is that of Union of the individual spirit with the Universal, since that is its highest aim.

The parallel classical western concept of ‘mens sana in corpore sano’- a healthy body in a healthy mind has always been recognised and is finding increasing emphasis today.

It has eight clearly defined aspects and in its purest form is a complete system capable of answering all human needs.

“CVU ζVuûG1/2 pXôB R} m

AVēn m AhPôe Lm B Y ç UôU”

- 3/4 Ø X 3/4 UK 3/4Wm
PRANAYAMA

Role of Pranayama

Pranayama has been assigned a very important role in the yogic system of exercise. In fact according to some yoga experts this is much more important than the yogasanas for keeping a sound health.

Pranayama - Pranā+Niyamam

“Prāna” Means - breath, vitality, air, energy and strength

‘Niyamam’ Means - control

Hence the literal translation is ‘Control of Breathing’.

In the pranayama practices there are four important aspects of breathing which are utilized These are

1. Pooraka or inhalation.
2. Rechaka or exhalation.
3. Antar kumbhaka or internal breath retention.
4. Bahir kumbhaka or external breath retention.
In our Siddha system various type of Pranayana are explained by our legend Siddhars.

**Instructions for Pranayama**

Sit in the position of Padmasana or Siddhasana.

Inhale through the left nostril, keeping the right one closed with the thumb of the right hand.

Hold the breath, close the left nostril with the ring finger and the little finger of the right hand, and exhale through the right nostril.

Then inhale through the right nostril, keeping the left one closed with the ring finger and the little finger of the right hand.

Hold the breath, close the right nostril with the thumb of the right hand, and exhale through the left nostril.

This completes one round of the exercise. Repeat the activity 4-5 times. Never exhaust yourself while doing this exercise.

**How Pranayama Acts on Cegana Vatham Patients?**

Pranayama produce a huge storage of energy in the solar plexus area. This will cause the body to radiate vitality and if any sickness is developing, the body can call upon some of this energy reserve to combat the pain. This pranayama can also improve brain function as well as increase the elimination of toxin from the body.
ASANAS

Prior to everything, asana is spoken of as the first part of hatha yoga.

Having done asana, one attains steadiness of body and mind freed from diseases and lightness of the limbs

- Hatha Yoga Pradipika (1:17)

Asana means a state of being in which one can remain physically and mentally steady, calm, quiet and comfortable.

In the Yoga sutras of Patanjali there is a concise definition of yogasanas. “Sthiram Sukham Aasanam”, meaning that position which is comfortable and steady. Asanas are specific body position which opens the energy channels and psychic centres. They are tools to higher awareness and provide the stable foundation for our exploration of the body, breath, mind and beyond.

Our Siddhars were well aware of the importance of the spine in relation to disease. Hence they explained many asanas and postures which were designed to make the spine more flexible to prevent spinal mis-alignments, and some may even correct minor spinal mis-alignments. The author had explained about few asanas for Ceganavatham patient as a preventive cure.

**Vertical Stretching Asanas:**
  - Tadasana (The palmae pose)
  - Parvatasana (Mountain pose)

**Lateral Stretching Asanas**
  - Konasana (angle pose)

**Posterior stretching asanas: (Forward bending Asanas)**

It should be kept in mind that in Ceganavatham patients who has the etiology of pain during forward bending should be prohibited from doing this type of asanas.
Asana       Complementary asanas
Yoga mudra (The Symbol of Yoga)       Bhujangasana
Hasta padasana (Arm Leg Pose)       Dhanurasana
Janusirasana (The Head Knee Pose)       Paschimottasana
Paschimottasana       Dhanurasana

By these forward bending Asanas the posterior spine is extended and which bring mental peace.

Anterior stretching Asanas:
(Backward bending posture)

Asana       Complementary asanas
Bhujangasana (Snake Pose)       Yoga mudra
Chakrasana (The Wheel Pose)       Pada Hastasana
Matsyasana (The Fish Pose)       Paschimottasana
Shalabhasana (Locust Pose)       Utthanapadasana
Ustrasana (Camel Pose)       Pada Hastasana
Dhanurasana (Bow Curve Pose)       Paschimottasana

Backward bending asanas increase the activity of jatharagni, which helps to burn and eliminate dross from the physical and subtle bodies. They open up the front vertex of the chakras. (Chakras are energy centres along the spine to the top of the head). In terms of the distribution of prana, samana, viyana vayu are stimulated by these types of asanas.

Spinal twisting Asanas:
- Meru wakrasana (spinal twist)
- Bhu Namanasana (spinal twist prostration pose)
- Ardha matsyendrasana (half spinal twist)

The twist imposed on the spine and the whole trunk exercises the muscles, makes the spinal column more flexible and stimulates the spinal nerves.
Relaxation Asanas:
They are especially recommended for any back/spinal problem.
  ➢ Advasana (reversed corpse pose)
  ➢ Jyestikasana (superior posture)
  ➢ Makarasana (Crocodile pose)

Procedures of Few Asanas:
1. Yoga Mudra (Reintegration posture)

Starting Position
  Sit in Padmasana

Method of practice
  Bring the hands to the backside of the trunk and hold the wrist of
  the right hand by the left land.

  Bending the trunk slowly forward and try to touch the ground with
  the forehead. If it is not possible try to hold the forehead as nearer to the
  ground as possible.

Benefits
  It allows the spinal column more flexible.

2. Paschimottasana

Starting position
  Sit on the floor with the legs outstretched, feet together and hands
  on the knees

Method of practice
  Raising the hands slowly sideward, upward without bending the
  elbows and hold them above the head.

  Bringing the hands slowly downward, forward without bending the
  elbows and try to catch the toes with fingers. If it is not possible try to
  hold the knees.

  Bending the body forward and try to touch the knees with the
  forehead without any strain anywhere in the body.
Benefits
It gives more flexibility to the vertebral column.
It stimulates circulation to the nerves and muscles of spine.

3. Bhujangasana (Snake pose)
Final position resembles handed snakes

Method of practice
1. Lie on the floor with facing downward. Keep the legs straight and together place the hands close to the body with palms facing downward.
2. Raising the head, neck and shoulder slowly one by one.
3. Raising the chest as much as possible in such a way that the lower abdomen should keep on in touching with the floor.

Benefits
- It strengthens the neck and back muscles
- It gives more flexibility to the vertebral column.

4. Matsyasana: (Fish pose)

Starting Position
Sit in Padmasana

Method of practice
Carefully bend backward, supporting the body with the arms and elbows. Lift the chest slightly, take the head back and lower the crown of the head to the floor. Hold the big toes and rest the elbows on the floor. Adjust the position of the head so that the maximum arch of the back is attained.

Benefits
It recirculates stagnant blood in the back, alleviating backache and cervical spondylosis.
5. **Dhanurasana (The Bow Curve Pose)**

**Starting position**

Same as Bhujangasana

**Method of practice**

Folding the right leg slowly at the knee and holding the angle with the right hand. Folding the left leg slowly at the knee and holding the ankle with the left hand. Raising the head, chest and thigh as high as possible by gradual application of force on the head and legs. Raising the body slowly and making a perfect back arch on the vertebral column as much as possible.

**Benefits**

Relaxes the spinal column

6. **Gomukhasana: (Cow Face Pose)**

**Posture**

Try to clasp the fingers of both hands behind shoulder blades, sitting with both legs bent in a manner where knees are overlapping.

**Benefits**

- Induce relaxation
- Relieves stiffness of shoulder and neck.

7. **Ardha Matsyendrasana: (Half Spinal Twist)**

**Posture**

Sit with right leg bent at the knee and bring heel under left thigh. Inter lock left heel with right knee.

Inhale and grasp left big toe with right hand fingers, give twist to the whole trunk with exhalation.

**Benefits**

It reduces the tendency of adjoining vertebrae to develop osteophytes. When practised with care, it has proved beneficial for mild cases of slipped disc.
8. Makarasana: (Crocodile Posture)

Method of practice

- This is a lying posture and taking rest.
- Lie flat on the stomach.
- Raise the head and shoulders and rest the chin in the palms of the hands with the elbows on the floor.
- Keep the elbows together for a more pronounced arch to the spine, separate the elbows slightly to relieve excess pressure on the neck.

Benefits

- Stops cervical bone disorders and helps one avoid using Neck brace.
- Releases compression of spinal nerves.

How Asanas relief the pain in Ceganavatha patients?

1. Effect on Spinal muscle

Asanas dampens the inflow of sensory impulses to the brain, which causes less stimulation to the emotional brain. (Limbic cortex, Hypothalamus, Anterior pituitary and their connectives with Adrenal glands). Therefore, there are less visceral disturbances to disturb attention and concentration. The reduction of sensory input creates a reciprocal chain, relaxing the muscle. Inhibition of synapses at the relaxed neuromuscular junctions in turn reduces the sensory input further. Thus asanas made musculature of spine as relaxed as possible.

2. Effects on tendons and ligaments

The accentuated curve of the spine makes it supple and mobile. The action on the ligaments and tendons of the spine has important effects on the nervous activity.
3. Effects on Nervous system

Acts on the spine by stretching it, generates reflex actions in the vegetative functions and tones the chains of ganglions situated on both sides of the spine.

EXERCISE

What is Exercise?

Exercise involves movements of muscles and joints that work in opposition to an external force. The direction range and elasticity of movement are predetermined by the state of muscle tone and their nourishment, the types of joints involved and the pull of the gravity.

Broadly there are three types of exercise

I. Active Exercise

Free hand exercise : Which acts only against gravity

II. Passive Exercise

Assited Exercise - Which involves external force to assist a weak muscle or an incoordinated movement to achieve the desired status.

III. Exercise against resistance

The resistance is applied in a graded manner to improve the strength and endurance of the muscles.

In Cegana Vatham patients both active and passive exercise are advised depending on to the patient’s condition.

Earlier stages - Active exercise

Later stages with Muscle atrophy - Passive exercises are recommended.

EXERCISE ADVISED FOR CEGANAVATHAM

Patient is advised to apply Yearanda thylam over the nape of the neck with both hands for 10 minutes and after, they are asked to do the following exercises.
1. NECK BENDING

a. Starting position

- Sit with both legs straight
- Place the palms on the floor by the side of the buttocks
- Keep the back, neck, and head straight
- Close the eyes

b. Practice

Stage I (Forward - Backward movements)

- Slowly move the head forward and try to touch the chin to chest
- Then move the head back far as comfortable
- Try to feel the stretch of the muscles in front and back of the Neck and the loosening of the spine in the Neck
- Practice 10 times
- Inhale on the backward movements and exhale on the forward movements.

Stage II (Bending to Right and Left)

Close the eyes and face directly forward.

- Slowly bend the head to the right side as cat touches the shoulder or lifting the shoulder.
- Bring the head back to the normal position.
- Then bend it to the left side and try to touch left shoulder with the left ear in the same fashion Lift the head to the centre.
- This is one round. Practice 10 rounds.
- Inhale with the upward movement and exhale with the downward movement.
Stage III (Turning the head to Right and Left)

- Keep the head upright and eyes closed.
- Gently turn the head to the right so that the chin is in line with the shoulder.
- Slowly turn the head to the left through the centre till the chin is in line with the shoulder. Bring the head to centre
- This is one round. Practice 10 round
- Inhale while turning to the front Exhale while turning to side.

c. Note (for all the three stages)

- Move the head as far as comfortable
- Keep the shoulder relaxed and unmoved.
- Feel the release of tension in the neck muscles and the shoulder muscle.

CONTRA INDICATIONS

- Should not be performed extreme positions by elderly people
- Cervical spondylosis cases should avoid during acute pain.

Benefits

- These asanas release tension (accumulated especially after prolonged work at a desk) and also heaviness and stiffness in the head, neck and shoulder region.

Additional points to note

- Make the movements cautiously and slowly when there is Neck pain
- Hold the Neck in the final position for a few movements
- If patients have pain at any stage, they are asked to stop in that position for a while.
Massage is a method originating in China in 300 B.C.

**Definition**

Many definitions of massage have been offered from time to time. Given below are some of the definitions.

- Massage is the scientific mode of curing certain forms of disease by systematic manipulations.
  - Murrel

- Massage refers to all mechanical procedures that can cure illness.
  - Hoffa

- Massage is a term applied to certain manipulations of the soft tissues. These manipulations are most efficiently performed with the palmar aspect of hand and administered for the purpose of producing effects on the nervous system, muscular system as well as on the local and general circulation of the blood and lymph.
  - Beard

- Massage is a healing art.
The above nine are the Thokka na procedures described in our system. In our inpatient ward, the author had advised the following Thokkana methods for the Cegana vatha patients.

**Therapeutic Uses**

"ûRødLQ j ¾ ] ôÄ W Rk úRóp F ½ Y Û Lhá Ä dá Ní d, Vg N a Wb m úTó- úUndL¾L éh¼ë\dLm éQ of ø Á Û Y L¾dá m ThP A Û XfNXñm Tôo"

In physiotherapy, massage is used for the following purpose

- To improve the mobility of the soft tissues.
- To reduce muscle spasm and pain under abnormal conditions.
- To reduce oedema.
- To increase circulation.
- To mobilise secretions in the lung.
- To induce local and general relaxation.
SEQUENCE OF THE MASSAGE

NECK REGION

Effleurage

Performed with palmar aspect of adducted fingers. It consists of 3 strokes in the following order. The direction of stroke is from upper to lower neck.

i) Side of Neck : Supra clavicular area
ii) Back of Neck : Supra clavicular area
iii) Middle : Side of Neck-Scapular Muscle – axilla

Kneading

➢ Finger pads are used on the posterior aspect from the occiput
➢ On the lateral aspect of the neck the fronts of the two distal phalanges of all four fingers are used.
➢ Flat handed kneading in upper thoracic area

Picking up

The lower part of the upper fibers of trapezus are compressed against the underlying bone

Wringing

Done for sternocleido mastoid muscle

Scapula rolling

The deep scapular muscles are intermittently compressed against the rib cage with potentials.

Hacking and clapping

➢ Performed on the Neck alone
➢ Start from occiput to lateral part of the Shoulder

HOW MASSAGE REDUCE CERVICAL SPONDYLOTIC PAIN?

Reflex in which peripheral and central portions of the nervous system both cerebro spinal and sympathetic are chiefly active, an impression made upon the nerve ends of the sensory or afferent fibres
(this is the area, the nerve is pinched where it leaves the spine) connected with the nerve centres of the cerebrospinal and sympathetic system being transmitted to the related centres, Where new activities are setup resulting in the sending out of nerve impulse by which vital changes are effected not only on the parts directly acted upon but in related parts also.

**VARMAM**

A slight misalignment of a vertebra, which impinges on the nerve, that travels to that particular organ. This cause interference to the life forces [nerve impulse] to the organ. As a result, the organ cannot function at its optimum level. If the spinal misalignment is not corrected to organ may develop pathology.

In our Siddha system, Siddhars explained these words as Varma diseases, results from derrangments of varma areas around cervical spine, which is given later.

The traumatological cervical disc lesion (Acute cervical disc lesions) may grouped under two categories:

1. Occurs in normal spine, as the result of sports injury in a young person.
2. Occurs in a person who already has an abnormal neck due to cervical spondylosis. For this patient sudden flexion or extension of the neck may lead to the symptoms of disc herniation.

**What is varma?**

A varma points is a place where the life forces is acting. If it is hurt in a particular manner and with forces, signs and symptoms develop according to the site of the point. If these signs and symptoms are not set right within the stipulated period death will occur. So these varma emergencies which can be called as orthopaedic emergencies according to recent medical science.
According to sites and symptoms, the author had given 3 Varmas.

MUDRA

Mudra is a hand gesture (or) position of body which is a symbol of energy centre. Mudra is a medium of communication of pranic energy and balancer of five elements. It brings harmony between conscious and subconscious mind.
Importance of Mudras:

- Mudra is a switch board of the body
- Chakras are activated by mudras
- Give the body energy
- Mudras control tridosas – vatha, pitha and kabha.
- Mudras purify the nerves, leads to knowledge, energy and joy of consciousness.

1. Aathi Mudra (or) Mustimudra.

   The tip of thumb should touch the Little finger base. The other fingers should enclose the palm.

   Effects:

   Symptom of Spondylitis gets reduced.

2. Visutha or Cervical Mudra:

   The tip of the index finger should touch the middle phalange of the thumb, while the other four fingers should point out in one direction. The pressure given by the under finger should be mild.

   Effect:

   Symptoms found in spondylitis, tonsillitis, thyroid dysfunction and lung disorders are reduced.
LITERATURE STUDY ON MODERN ASPECTS

ANATOMY

VERTEBRAL COLUMN

Human Skeleton is divided into axial and appendicular sections. The axial skeleton structures include cranium, vertebral column and associated ribs and sternum. The vertebral column protects the spinal cord and its meninges. It forms a pillar, which contains 33 segments and lengthens about 70 cm in male and 60 cm in female. The segments can be divided into cervical, thoracic, lumbar, sacral and coccygeal segments.

The cervical segment has seven vertebral bones, thoracic twelve, lumbar five, sacral five and coccygeal four. All are separate bones except sacrum and coccyx. Both are formed by fusion of separate bones.

The Curvature of the Spine

There are four curvatures in the vertebral column. They are two primary and two secondary curvatures.

The primary curvatures are the thoracic and sacral. They are convex posteriorly. The secondary curvatures are convex forwards. The cervical curvature becomes prominent when the child is able to hold its head up and sit upright. The lumbar curvature appears by 12-18 months after the child starts walking.

Lateral Curvature

A slight lateral curvature seen in upper thoracic region. It is curved to the right in right handed person and vice versa.

General Features

a) Vertebrae

The vertebrae can be divided into vertebral body and vertebral arch. The body is cylindrical, large in lumbar region. Vertebral arch has two pedicles, seven processes, and two laminae. The laminae are vertical, plate like structures, faces together to form spinous process. The spinous
process projects downwards and is the levers for the muscles. The articular processes are four in number and bearing an articular facet and articulate with the adjacent vertebrae. Transverse processes projects laterally from the junction of pedicle and laminae. In thoracic region they articulate with ribs.

**b) Inter vertebral discs**

They are fibro cartilaginous discs and interposed between the adjacent surfaces of vertebral bodies. They are thicker in lumbar region than in thoracic. Their peripheral parts are supplied by the adjacent blood vessels. But the central part is avascular. They receive their nutrients by diffusion from spongy bone of adjacent vertebrae.

**Cervical Vertebrae**

Cervical vertebrae are seven in number. The first, second, and seventh are modified (or) atypical vertebrae.

The cervical vertebrae are smaller than lumbar and thoracic vertebrae. They have large vertebral foramen to accommodate the cervical swelling of the medulla. All cervical vertebrae have a foramen in the each side of the transverse process known as Foramen Transversorium through which vertebral artery, vein and plexus of nerves are transmitted.

The body of the vertebrae is oval and its superior surface is concave from side to side.

**Pedicles**

These are short in size and projects upwards and backwards from the middle of posterolateral parts of body and then from the posteromedial wall of the foramen transversorium.

**Laminae**

These are long and rectangular and almost overlap their neighbours in extension
**Spinous Processes**

These are short and bifid.

**Articular Facets**

These are the oblique cut ends of short bone, the articular process lying at the junction of pedicle and laminae on each side. The superior facet faces upwards and backwards, the inferior facet faces downwards and forwards.

**Ventral Foramen**

It is large and triangular in shape.

**Transverse Process**

Each transverse process is short and perforated by the foramen transversorium. The costal process projects laterally from the body. Behind the transverse foramen, the true transverse process lies laterally from the junction of pedicle and laminae to end in posterior tubercle.

**Atypical Cervical Vertebrae**

**Atlas**

It supports the globe of head. It has no body. It consists of two lateral masses united by an anterior and posterior arch. The body represented by the dens, a tooth like projection from the superior surface of body of C2. Lamina is present in posterior arch. It is grooved on its superior surface behind the lateral mass. The spine is replaced by the posterior tubercle. The superior and inferior facets lie on the lateral masses anterior to the first and second cervical nerves respectively.

**The Axis**

The axis has a peg like projection in the upper part of body known as dens (or) Odontoid process. It has a circular facet anteriorly, articulating with atlas. There are two articular facets on either side. Laminae are thick. The spine is large bifid and powerful. The transverse processes are small and possess a tubercle on its tip.
**Seventh Cervical Vertebrae**

The spine is long and non-bifid. The transverse process does not possess anterior tubercle. The foramen transversorium transmits only veins.

**Joints of Vertebral Column**

The vertebrae from the 2nd cervical to lst sacral inclusive are articulated to one another by series of cartilaginous joints between vertebral bodies and a series of synovial joints between the vertebral arches. The vertebral bodies are united by antero-posterior longitudinal ligaments and by a central vertebral disc of fibro cartilage.

**Atlanto-occipital Joint**

It is a synovial condyloid variety joint. Articular ends are superiorly with convex occipital condyles, and inferiorly with superior articular facets of the atlas. Ligaments, capsules, anterior and posterior atlanto occipital membranes are the adjacent structures. Vertebral artery supply to this joint. Nerve supply is by first cervical nerve. Movements flexion, extension and lateral-flexion.

**Atlanto-axial Joint**

**Comprises of**

a) A pair of lateral atlanto axial joints and  
b) Median atlanto-axial joints

**a) Lateral Atlanto Axial Joint**

Synovial Joint : Plane variety  
Articular Ends : Inferior facets of atlas and superior facets of axis.  
Ligaments : Anterior longitudinal ligament and Ligamentum flavum.

**b) Median atlanto axial joint**

Synovial Joint : Pivotvariety  
Articular Ends : Between the dens of axis, anterior arch of atlas.
Ligaments: Transverse ligament
Movements: Rotatory movements around a vertical axis.

Ligaments Between the Axis and Occipital Bone:
1. Occipito - Axoid
2. Odontoid / Chech Ligaments

Movement - Limit the extend of rotation of craniam

The Unco Vertebral Joints (Luschka’s Joints)

These are not true synovial joints, which develop as a result of degenerative changes in the edges of the disc in early adult life. Luschka’s are important because

a) They are commonest site of osteophyte formation. These osteophytes may compress the cervical nerves.

b) Vertebral artery lies lateral to the joints. Intruding on the canal can cause distortion of the artery and leads to vertebro basilar insufficiency in atherosclerotic vessels.

Blood supply of vertebral column:

Vertebrae and longitudinal muscles attached to them are supplied by segmental arteries. The ascending cervical, intercostals, and lumbar arteries give multiple small branches to the vertebral bodies. The extensor muscles are supplied by occipital, deep cervical, and the transverse cervical arteries. In thoracic and lumbar regions the muscle receives posterior branches of the intercostals, lumbar, and lateral sacral arteries.

Venous drainage

The internal venous plexus lies within the vertebral canal but outside the spinal dura. It received tributaries from

i) The vertebrae through the basilo vertebral veins

ii) The meninges and the spinal cord

The internal vertebral venous plexus drained by the intervertebral veins which passout through the intervertebral foramina. Here they are
joined by the tributaries from the external vertebral and sacral veins. About the internal nervous plexus communicate with the occipital and basilar veins through the foramen magnum.

**Nerve supply of vertebral column**

The anterior longitudinal ligament has rich innervation from the vertebral plexus which derives sensory innervation from cervical, glossopharyngeal and vagus nerves and autonomic supply from inferior cervical and stellate ganglion. The sinus vertebral nerves and the sympathetic fibers supply posterior longitudinal ligament and periosoteum. The apophyseal joints and the interspinous ligaments are supplied by dorsal rami. There is significant overlap of segmental innervation.

**Movements of vertebral column**

The greater thickness of the discs in the cervical and lumbar regions as compared with the thoracic region is associated with the greater individual ranges of movements occurring in thoracic regions.

Flexion or forward bending, extension or backward bending, flexion-rotation, and circumduction are all possible in vertebral column. Numerous muscles are attached directly on the vertebra.

**Structures Passing Through**

**A. Foramen Transversorium**
- Vertebral Artery
- Verterbral Vein
- Plexus of Sympathetic nerve

**B. Intervertebral Formen**
- Spinal nerves form dorsal Medulla

**Functional Anatomy**

**a) Cervical Nerve**
There is 8 pair of cervical Nerves. Each nerve root contains sensory, motor, sympathetic fibres that innervate the upper extremities. Sensory supply termed as dermatomes and motor supply as myotomes. 30 percent of the motor roots also transmit sensation toward the cord. The sympathetic fibres innervate the blood vessels, sweat gland and hair follicles

**b) Cervical spine**
The spine is divided into anterior and posterior columns. The component parts of anterior column are
- Anterior Longitudinal Ligament (ALL).
- Annulus Fibrosus (ANN)
- Unco Vertebral Joint.
Posterior column consist of
- Nerve Root (NR)
- Facet
- Superior Ligament
- Posterior Longitudinal Ligament

c) Intervertebral Disc

The gelatinous central portion of the disc is called the nucleous pulposus. It is composed of around 80-90% water. The outer ligamentous ring called the Annulus fibrosus, which hydraulically seals the nucleus, and this annulus fibrosus contains collagen bundle at periphery and fibro cartilaginous tissue in the inner part.

The annulus has overlapping radial bands, not unlike the piles of a radial tire. The thickness of discs varies daily thick in morning due to absorption of fluids in lying posture during night and it is thin at night.

Intervertebral Disc - Physiology

i) As a Spacing

Proper spacing of intervertebral disc allows the intervertebral foramen to maintain its height, which allows the segmental nerve roots to exit each spinal level without compression.

ii) As a Shock Absorber:

iii) As a Motion Unit:

The elasticity of the disc allows motion coupling. So that the spinal segment can flex, rotate, and bend to the side all at the same time during a particular activity.

iv) As a Hydraulic Cylinder:

The annulus interacts with the nucleus. As the nucleus is pressurized the annular fibres serve a containment function to prevent the nucleus from bulging or herniating. The gelatinous nuclear material directs the forces of axial loading outward and the hoops of annular fibres help to distribute that force without injury.

Below this value suggests cervical spondylosis.

### CERVICAL SPONDYLOSIS

#### Nomenclature

- **Cervic (o)** - Latin Word, means neck.
- **Spondylo** - Greek Word, means Vertebra
- **Osis** - Condition

- Is a type of pathological condition involving cervical vertebra.

#### Synonyms:

- Cervical Spondylotic Myelopathy : Burner Syndrome
- Cervical Osteoarthritis : Pinched Nerve
- Cervical Degenerative joint disease: Brachial Plexus injury
- Cervical Radiculopathy : Cervical Discogenic Pain Syndrome
- Cervical Osteophytic bars. : Cervical Facet Syndrome
- Cervical spine sprain : Rotator cuff injury

#### Definition

Cervical spondylosis is a disorder characterized by changes in the vertebral disc and surrounding ligaments caused by abnormal wear on the cartilage and bone of the neck with degeneration and mineral deposits in the cushions between the vertebrae.
**Chronology**

In 1901, Sir Victer Harsely explained compression of cervical spine due to progressive CSM. Hayashi in 1987 contributed the Spondylotic changes of spine.

**Epidemiology**

Cervical Spondylosis is present in 20-25% of population by the age of 50 years and increases to 70-85% by the age of 65 years (From Radiographic evidence)

**Location**

- Generally the C5 and C6 roots are most commonly affected by cervical Spondylosis as a result of the increased mobility at the C5-C6 and C6-C7 levels.
- Acute disc lesions are seen most often at the C7 level followed by C6.
- High level cervical disc involvement are very uncommon.
- T1 Radiculopathy is caused by the result of involvement by Pancoast tumour in the apical pleura.

**Etiology**

Causes of this disorder are explained as follows.

**a) Degenerative Causes:**

They are primary and secondary

**Primary** - Senility  
Genetic Factors  
Metabolic factors  
Manual Labour  

**Secondary** - Osteo arthritis  
Rheumatoid arthritis  
Metastatic Carcinoma  
Lymphoma of spine  
TB Spine
b) Injury
- Automobile accidents with whiplash injury and athletic injury
- Sudden jerks on the arms during falling down.
- Previous injuries with fracture or disc prolapse.

c) Occupational Causes: Beedi rolling, Tailoring, Teamasters, Home maker

d) Hereditary Factors
Congenital narrowing of the cervical spinal canal (myelopathy is often seen when canal’s sagittal diameter is 12mm or less.)
- Segmental defects - Hemi vertebra, Fused Vertebra.

e) Acquired narrowing of cervical spinal canal due to
- Osteophytes.
- Ossified posterior longitudinal ligament (OPLL).
- Facet joint hypertrophy (Results foraminal stenosis and compression of root of radicular artery).
- Hypertrophied ligamentum flavum (Compress the cord during extension).

Factors Responsible for Myelopathy in cervical spondylosis:
1. Uncovertebral osteophytes cause anterior compression of cord.
2. Bony ridges on the posterior vertebral bodies cause central compression on the cord.
4. In curving of the ligamentum flavum causing posterior compression on the cord.
5. Development of narrow cervical canal.
7. Calcification of the posterior longitutidinal ligament.
8. Teethering of the roots to the osteophytes.
10. Interference of blood supply to cord.
PATHOGENESIS

In disc degeneration the primary event is a progressive decrease in the degree of hydration. Glycoproteins diminish in size and number their ability to retain water diminishes. This results in loss of disc height, disc fibrosis and annular weakening. Adjacent vertebral bodies approximate each other and uneven abnormal movement in the affected areas probably results in osteophyte formation. These occur at all the joints, namely the disc, zygoapophyseal joints and the neurocentral joints of luschka. Though osteophyte formation may be the body’s attempt to stabilize the joints their growth can result in narrowing of the spinal canal and cord compression.

The predisposing factors which may accelerate of these changes viz.

1. Occupation requiring repetitive motion and chronic flexion of the cervical spine.
2. Previous injury with fracture or disc prolapses.
3. Segmentation defects like hemivertebrae or fused vertebrae.
4. May be a hereditary predisposition to intervertebral disc disease.

Pathology:

Cervical spondylosis is very common and histological evidence of degenerative changes is present in virtually even present over the age of 70. Osteophytes may form posteriorly with osteoarthritis of the apophyseal joints and also anteriorly in relation to degenerative changes and narrowing of the intervertebral disc with sclerosis of the bony end plates. The osteophytes may cause symptoms by encroaching on the spinal nerve foramina or in the cervical region on the vertebral artery foramen. In the cervical region intermittent pain and discomfort may be followed eventually by stiffness and limitation of movements.
At first injury to be chondrocytes occur and therefore, the maintenance of articular cartilage impairs and if this continues loss or decreased synthesis of proteoglycans occurs. Another theory is with decades of weight bearing. There is remodeling of the articular cartilage with redistribution of load stress chondrocyte integrity mainly depends on normal level of loads. Chondrocyte degeneration or injury occurs as a result of overloading or under loading and loss of proteoglycans has been contributed by alteration of subsynovial weave of collagen fibres.

Chondrocyte injury causes release of degradative enzymes particularly proteoglycanase and cathepsins. At the same time the capacity of synthesis of proteoglycans diminished due to age and chondrocyte injury. Injury causes alteration in collagens and there occurs change from type II to type I. The Type I collagen withstands minimally to stress. All this causes cartilage injury.

**Morphology:**

The early changes appear to be erosion and flaking of cartilaginous surface with advance of the disease clefs appear within the cartilage at right angles to the surface. The clefs may penetrate to sub chondral bone producing cartilage fibrillation. Sometimes fragments of cartilage break off to create joint mice. This cartilage injury results in growth of blood vessels from the subchondral bone into articular cartilage. These occur focal cystic areas within the subchondral bone and they contain fibrous tissues. The further progression of the disease, leads to deep or complete erosion of cartilage layer.

The disappeared and leaves denuded subchondral bone which is dense smooth, glistening to ivory. This is known as Eburnation. The loss of cartilage accounts for the so called thinning of joint space, which is seen radiographically.
Osteophytes developing from margins of articular cartilage may sometime extend to the ligamentous and capsular attachment and is called “bone spurs” of osteoarthritis. When large spurs project from opposing bones come into contact causing pain and limitations to movements. These bony spurs accounts for nodules known as “Heberden’s nodes.”

**Intervertebral Disc Prolapse**

This is common cause of compression of the nerve roots and more rarely causes compression of the cord. The intervertebral disc consists of a central module semifluid matrix, the nucleus pulposus, surrounded by a ring of fibrous tissue and fibrocartilage, the annulus fibrosus. The posterior segment of the annulus is thinner and less firmly attatched to bone and following unusual stress part of the martix of the nucleus pulposus may hereniae through it. The lesion often termed “Slipped disc” may occur after injury and symptoms depend on the direction taken by the extruded matrix. It usually tracks posterior laterally around the expansion of the posterior longitudinal ligament, appearing at one side and compressing the spinal nerve in the intervertebral foramen. Disc protrusion occurs, principally in C5 –C6 and C6 – C7 discs.

A single mid line posterior disc protrusion may compress the spinal cord, obstructing the anterior spinal artery, and is a rare but important cause of permanent damage to the spinal cord if surgical treatment is delayed.

When there are several protrusions, the resulting compression may impair the circulation and variable effects of ischaemia of the spinal cord may result. There may be cavitation of the cord and loss of nerve cells in the severely affected areas, the condition being known as “Spondylotic myelopathy”. Nerve root compression is commoner than myelopathy.
**Pathogenesis of Myelopathy and Radiculopathy:**

The various factors that play a role are:

1. **Congenital narrowing of the Cervical Spinal Canal:**
   
   This can be a major cause of myelopathy – canal narrowing is usually generalised but can occasionally be seen at one or two levels from C2–C7. Myelopathy is often seen when the canal sagittal diameter is 12 mm or less.

2. **Acquired Narrowing of the Spinal Canal:**
   
   This can be due to:

   I. **Osteophytes:**
      
      The osseous spurs can also give rise to irritational fibrosis of dural sleeve of the nerve root.

   II. **Ossified posterior longitudinal ligament (OPLL):**
      
      OPLL is characterized by heterotrophic new bone formation in ligamentous tissue and may be due to the activity of osteoblastic phenotype cells.

   III. **Facet joint Hypertrophy:**
      
      This lead to foraminal narrowing with resultant compression of the nerve root and the radicular artery.

   IV. **Hypertrophied Ligamentum Flavum:**
      
      During extension, the cord is compressed by the thickened ligament over the anterior osteophytic ridge and this may occur more frequently, a relatively more immobile are due to spondylotic changes.

   V. **Movement Disorders:**
      
      Chronic movement disorders like torticollis and athetosis can induce premature spondylotic changes in the cervical spine.

   VI. **Trauma:**
      
      Trauma, such as whiplash injury may cause structural changes that predispose towards premature degenerative disc disease.
3. **Dynamic Factors:**

The spinal cord moves within the spinal canal and the cord and root becomes taut in flexion and lax in extension with an increase in the posterior contour by almost 5 cm and the anterior contour by upto 2 cm. Dural adhesions to the posterior longitudinal ligament and the root sleeves to the foramina make the cord more susceptible to injuries.

4. **Vascular Factors:**

Vascular compromise by compression of the anterior spinal and radicular arteries and veins. The anterior sulcal arteries can be compressed and flattened due to degenerative changes with a reduction in blood flow. Though, the anterior radicular arteries exist at every level, the main artery is between C 4 – C 6. As Cervical spondylosis occurs mainly at these levels, compression of the main radicular artery in the foramen may be responsible for the ischaemia of the cord.

The combined effects of the compressive tensile and shear forces produces recurrent sub acute changes of demyelination in the posterior columns and the lateral spino – thalamic tracts. There is a relative sparing of anterior white mater tracts and a varying degree of grey mater degenerative changes.
Eburnation

Erosion and Flaking

Appeareance of clefts

Developments of Osteophytes

Bony spurs

Large spurs - leads to pain

Heberden's Nodes

Breaking of cartilage fragments

Joint mice creation

Growth of Blood vessels from subchondral bone

Eburnation
In cervical spondylosis, changes occur in the following structures.

- Intervertebral disc
- Uncovertebral joints
- Apophyseal joints
- Formina

**Intervertebral Disc**

All the three parts of disc cartilage plate, nucleus and annulus are involved.

**Cartilage Plate**

First the cartilage plate thins out and cracks. Fissuring and erosion is common. The whole plate is replaced by fibrous tissue.

**Nucleus**

Nucleus becomes fibrous with degeneration. The process of dehydration occurs and concludes with reduction in water binding mucoprotein.

**Annulus**

Annulus undergoes some changes as in nucleus. Focal necrosis and calcification is common. They form hard ridge within the cervical canal. Osteophytes are formed as a result of instability producing stress on the periosteum.

**Uncovertebral Joints**

The uncovertebral joints are most affected as C5-C6 and C6-C7 level. Progressive decrease in disc height, the uncinate process approximates against the vertebral body undergoes erosion and formation of osteophytes.

**Apophyseal Joints**

They may remain unaffected for long time. When they are subjected to heavy weight pathological changes like erosion, degeneration, lipping, and osteophyte formation occurs.
Foramina

Foramina are narrowed by fibrous tissue. The posterior longititudinal is thickened.

MICROSCOPICAL CHANGES

1. Demyelination most prominent in lateral column at levels of os teo phy tic bars.
2. The medial portion of the long myelinated tracts is affected.
3. Loss of anterior horn cells.
5. Arachnoiditis around nerve sleeve.
6. Demyelinated plaques, swelling of myelion, axons and glia is found in the white matter.

BIO - CHEMICAL CHANGES

The Biochemical changes in IVD, due to the cumulative effect of injury, ageing, load stress of chondrocytes diminishes the synthesis of proteoglycanase, cathepsin and leads to the alteration in collagen type II to type I. All causes cartilage’s injury.

Cervical Spondylotic changes in the aged

Generally cervical spondylosis is more common at C5-C6 and C6-C7 levels. As age advances the range of motion at these levels decreases.

The upper levels of C3-C4 and C4-C5 have more mobility and vertebral olisthesis in extension (retrolisthesis) while narrowing of the intervertebral disc and osteophytes predominates at the lower disc levels of C5-C6 and C6-C7. These are related changes of the cervical spine influence the AP diameter of the canal in the aged. AP diameter is a good indicator of myelopathy.

Under the influence of these ageing changes in the cervical spine, disc protrusion, posterior osteophytes at C5-C6 or C6-C7 and retrolisthesis at C3-C4 or C4-C5 were important as the primary
etiological factor of myelopathy is the ageing patients. Also the atrophic
type of morphological spinal cord changes on CT myelogram was seen
with high incidence in the aged patients. It was never seen in the younger
patients.

Clinical Features of Cervical Spondylosis

Symptoms

1. Pain in Cervical spine disease either local, referred or radicular.
2. Pain is commonly referred upwards to the occiput downwards to
   the interscapular region or laterally to the shoulder and upperarms.
   It is usually characterised as an “ache” and is not usually felt below
   the elbow.
3. True radicular pain is sharper than referred pain and its distribution
   follows a dermatomal pattern.
4. Neurological dysfunction may be sensory or sensory plus motor.
5. Radicular sensory/motor symptoms are rarely painless. Paresthesia
   is followed by numbness and clumsiness as proprioception
   becomes affected.
6. Cord compression may cause myelopathy which may in acute case
   (Eg. trauma, metastatic collapse) be initially flaccid but which
   rapidly becomes spastic.
7. Symptomatically the spasticity in chronic cases gives rise to “jumpy
   leg” usually at night, and leads to stiffness and clumsiness.
8. Lhermitte’s sign - Where flexion causes an electric shock like
   feeling to shoot into the arms and legs may be seen in spondylosis.
9. Acute cord compression in spinal injury is well known to cause
   priapism.
10. In extreme cases of degenerative disease, anterior osteophytes can
    cause dysphagia.
Examination
Symptoms fall into 5 main groups.

1. Radiculopathy
2. Myelopathy
3. Neck pain
4. Headache
5. Vertebrobasilar insufficiency.

Radiculopathy
Results from nerve root compression and consists of shooting pain (pins and needles) radiating along the dermatomal distribution of particular nerve root usually into forearm or fingers.

There is also frequently referred pain and tenderness along the medial border of the scapula.

Myelopathy
Myelopathy can be classified in various ways and depends on the involvement of the lateral or medial cord or vascular involvement. The signs may be a mixture of upper motor neuron signs in the lower limbs and lower motor neuron signs in the upper limbs.

Generally myelopathy may be predicted by central disc herniation, but is more commonly the result of spondylytic changes superimposed on a congenitally narrow canal. Motor weakness is rare. If they occur there may be marked wasting of the muscles.

Neck Pain
Pain is present in nape of the neck and its nature is aching or boring quality which radiates to the shoulder blades, top of the shoulder, upper arm and hands or back of the head. Clinically it is very difficult to decide, which disc is responsible to pain. Patients feel of crunching sounds with the movement of the neck or shoulder muscles.
Headache

Headache is a common symptom, its pathogenesis is not fully understood. It is more a pain than a headache usually located in occiput on both sides. It spreads to the temple or eyes. It is described as a tight band round the head.

Vertebrobasilar insufficiency

VBI usually requires a combination of arterosclerosis and osteophytes intrusion into the foramen transversorium. The symptoms of this insufficiency are typically a brief attack of giddiness without loss of consciousness and generally brought by head movements.

Autonomic symptoms

Vertigo, flushing, tinnitus and visual blurring are the autonomic symptoms produced by cervical disc diseases. These may be mediated by sympathetic distribution to the sinuvertebral nerves from stellate ganglion.

Signs

Common

Atrophy of the hand musculature (Intrinsic muscle atrophy)

- Hyper reflexia
- Lhermitte’s sign - positive
- Spurling test - positive
- Sensory abnormalities
- Loss of vibratory sense or proprioception in the extremities especially in the feet
- Superficial sensory loss.

Rare signs

- Ankle clonus
- Babinski’s sign
- Hoffmann’s sign
### Summary of the site of lesion

(Cervical spondylosis can produce cord compression (upper motor neuron signs) or root compressions (lower motor neuron signs)

Classification of CSM
(Based on Nurick’s Grade Description)

- **Grade - 1**: Signs of spinal cord disease but no difficulty in walking.
- **Grade – 2**: Slight difficulty in walking, employed full time.
- **Grade - 3**: Difficulty in walking, affects ADL, still independent
- **Grade - 4**: Assistance to walk
- **Grade - 5**: Chairbound or bed ridden.

Stepwise physical examination
Examination divided into several categories, which were done for Ceganavatham in-patients.

**Posture**
- Have a smooth cervical lordosis with gentle transition into thoracic kyphosis.
- Compensatory increase in the lumbar and cervical lordosis.
- Cervical range of motion

**(ROM) – Cervical**

Provocative Tests

Used to determine the differential diagnosis.

1) Spurling Test (Foraminal Compression Test)

Extends the neck and then rotates and laterally bends the head to the same side, while the examiner applies downward pressure to the top of the head. If this position, with or without pressure reproduces radicular symptoms into the upper limb, cervical spondylosis is suggested.

2) Lhermitte sign

Where flexion causes an electric shock like feeling to shoot into the arms and legs may be seen in spondylosis.

3) Phallen Wrist Flexion Test

Full passive flexion of the patient’s wrist for 30-60 seconds and looking for reproduction or worsening of finger dysethesiasis.

4) Tinel’s Sign

Elicited by tapping over the median nerve at the carpal tunnel.

5) The Elbow Flexion Test

Fully flex the elbow and observe for ulnar nerve distribution.

6) Adson’s Test

Turns his head to the involved side raises the chin and holds a deep inspiration and while the ipsilateral radial pulse is palpated with the arm slightly abducted from the side. If pulse diminishes- test positive-suggest Thoracic outlet syndrome.
7) Roo’s test

The patient is asked to abduct the shoulders 90°, flex the elbow 90° and open and close the hands slowly for 3 minutes.

- Hand pallor
- Ulnar dysesthesias
- Diminished pulse

Positive

Suggest thoracic outlet syndrome.

Pathologies that mimic cervical spondylotic myelopathy

Sign and symptoms of the few of the following diseases mimic cervical spondylosis.

- Amyotrophic lateral sclerosis
- Extrinsic neoplasia (metastatic tumours)
- Hereditary spastic paralysis
- Intrinsic neoplasia (Tumours of spinal cord parenchyma)
- Multiple sclerosis
- Hydro cephalus
- Thoracic outlet syndrome
- Spinal cord infraction (syringomyelia)
- Vit B12 deficiency.

Investigation:

Mainly based on X-ray.

1) X-ray Cervical Spine

- Anteroposterior (AP) view
- Right oblique
- Lateral view
- Left oblique
AP odontoid views shows
  - Disc space narrowing
  - Osteophyte formation
  - Degeneration in facet and Uncovertebral joints
  - Foraminal stenosis (seen in oblique films)

2) Myelogram - May show compression of the spinal cord.

3) C.T. Scan (Computerised Tomography)
   Confirms degenerative changes
   May demonstrate posterior osteophytes and disc herniation

4) MRI (Magnetic Resonance Imaging)
   Neural compression, Intrinsic cord changes, Disc degeneration

5) Examination of CSF
   Very high protein

6) Other tests
   Nerve conduction studies, Electromyelography (EMG)

Differential Diagnosis:
In most cases of cervical spondylosis either radiculopathy or myelopathy is the presenting features. Clinical features of many diseases may mimic cervical radiculopathy and myelopathy.

Radiculopathy
The symptoms of lesion of the brachial plexus, such as neurofibroma, the thoracic outlet syndrome, and pancoast tumour are superficially similar to those of disc disease.

1. Pan Coast Tumour
Pan coast tumour results from local extension of a tumour growing in the apex of the lung with involvement of the eighth cervical, first and second thoracic nerves, with shoulder pain which radiates in the ulnar distribution of the arm, and often with radiologic destruction of the first and second ribs.
2. Referred Pain
Cardiac ischaemia causes left sided brachial neuralgia. In those patients, diagnosis depends on the history, examination and abnormal findings in E.C.G.

Sub – diaphragmatic lesions – cause right sided pain
Gall bladder lesions cause right sided. Brachial neuralgia. The diagnosis depends upon the history examination and investigations.

Myelopathy
New growth of the spinal cord at cervical level may mimic the features of cervical spondylosis. But it can be differentiated by radiological findings, examination of cerebrospinal fluids and myelography.

1. Tumours of the spinal canal
i.) Extra dural (or) epidural tumours
Commenest extra dural tumour is the spinal metastasis. The symptoms are local pain, radiating pain which is exacerbated by coughing, sneezing or straining. Pain and local tenderness often proceed other symptoms.

ii) Intradural tumours
a. Extra medullary tumours (Meningiomas neur ofibromas)
Local back pain, sensory loss below the level of the pain, weakness and bladder and bowel dysfunction.

b. Intra medullary tumours
Dissociated sensory loss in the segments of tumour orgin and sparing of posterior column sensory function.
Later spino thalamic tracts may be involved. The sacral segments may be spared. Atrophy in the appropriate segments due to anterior horn cells involvement.
2. Epidural abscess

The condition can occur as a complication of operation or lumbar puncture. Spinal osteomyelitis acts as the nidus for abscess formation. Unexplained fever and mild spinal ache, later radicular pain occurs. As the abscess expands it caused cord. Compression with a transverse and usually complete transaction syndrome.

3. Amyotrophic lateral sclerosis

Upper motor neuron signs in Lower limbs and lower motor neuron signs in upper limbs.

4. Other unusual compressive lesions

Cervical cord compression from destruction of the cervical apophyseal or atlanto axial joint’s rheumatoid arthritis. It may present as a chronic compressive myelopathy similar to cervical spondylosis.

5. Syringomyelia

Dissociated sensory loss wasting of the small muscles of one of other hand, loss or one of more reflexes in the arms and hyporeflexia in the legs and extensor plantar responses are common Charcot joints in the shoulders elbows (or) knee are common in advanced cases.

Syringobulbia

Dissociated sensory loss on the face, palatal palsy, Horner’s syndrome and nystagmus kyphoscoliosis pescavus and spinabifida are often found.

6. Tabes dorsalis

Fleeting and repetitive shooting pains occurring mostly in the legs. Loss of reflexes in the legs, impaired position and vibration sense gives severe ataxic gait.Romberg’s test is positive. Argyll Robertson pupils constitute a typical tabetic facies.
Diagnosis:

The clinical diagnosis is arrived from the features of cervical radiculopathy and myelopathy. That diagnosis may be confirmed by the radiography, myelography, tomography and magnetic resonance imaging.

Complication:

1. Pseudo arthrosis
2. Graft displacement
3. Neurological injury
4. Spastic gait and
5. Injury to other structures
   - Recurrent laryngeal nerve
   - Superior laryngeal nerve
   - Carotid artery
   - Oesophagus

MANAGEMENT

1. Non – Operative:
   - Analgesics
   - Local modalities
   - Exercise programme and cervical traction.

2. Operative:

Operative treatment should be considered.
   - In the presence of intractable pain.
   - Where there is evidence of radiculopathy or myelopathy.
   - Where osteophytes are producing vertebro basilar insufficiency.

Cervical Radiculopathy:

Conservative treatment with analgesics and a cervical collar results in resolution of symptoms in the great majority of patients. In chronic complicated cases foraminectomy or disc excision to be recommended.
Cervical Myelopathy:

Surgical procedures, including laminectomy and anterior excision of disc may arrest progression in disability but do not usually result in neurological improvement and carry a significant risk particularly in the elderly, the judgements as to where surgery should be undertaken may be difficult. Manipulation of the cervical spine is no proven benefit and may precipitate acute neurological deterioration.

Physiotheraphy:

In acute exacerbation of disease affecting the cervical spine, rest may be the initial treatment.

Cervical Collar:

Cervical collar are advised to wear temporary collar. (Which is often made from Plastazote) for day time to restrict movement, and a soft collar for support at night. A patient who is given a collar should be advised that the restriction in neck movement will alter other proprioception, for example he will need to take care in the dark or on entering darkened rooms when he may lose his balance. A patient wearing a collar should not drive because judgement of relative distances will be impaired. In the cases of vertebro basilar insufficiency (VBI) cervical collar may be advised to the sufferers according to the severity.

Cervical Traction:

Vertebral traction should be the first choice of pain relief for patients suffering nerve root pain. Intermittent sustained traction is carried out after careful positioning has localized the involved segment in such cases the treatment atleast once a day is essential, prolonged pain relief will take several days to obtain.

Cervical traction provides positive patient response and can relieve the pain associated with certain neck disorders. It applies a stretch to muscles, ligaments and tissue components of the cervical spine. It
provides relief by promoting separation of the intervertebral joint space, which contains the disc and may reduce a “bulge” or impingement of structures within the foramen. It is no indicated for use in condition of instability such as with “Whiplash” injury. It is most commonly used when the patient is in the supine position (lying on the back with knees bent at a 45° angle) with the neck placed at 20° - 30° of flexion (forward tilt). Using traction in this position helps stretch the posterior neck muscles and facilitate intervertebral separation, which relieves pressure that may be pinching nerves, therefore, promoting muscle relaxation and intervertebral separation.

**Exercise for Cervical Spondylosis:**

To start with, exercises should be done sitting and the feet must rest on the floor or stool. Exercises should be done in front of a mirror, in order to get correct movements.

1. **Static Head & Neck Exercise:** (no movement take place, muscles are strengthened)

   - Place your hand on your forehead, with the hand stop forehead from bending forwards – 3 times increase to 5.
   - Place the hand behind the head, with yours hand stop the head from bending backwards -3 times increases to 5.
   - Place right hand on right cheek and ear, stop the head from bending on right side – 3 times increases to 5.
   - Place the left hand on left cheek and left ear, stop the head from bending on left side – 3 times increase to 5.
   - Place right hand on right lower jaw stop the head from turning to right side -3 times increase 5.
   - Place left hand on left lower jaw, stop the head from turning to the left side 3 times increase to 5.
In order words give resistance with your hands to work the muscles as much as possible. Continue the above static exercises. If these suit, otherwise discontinue the static exercises.

2. Excercise for Shoulder:

- Arms lift forwards, up and down – 5 times increase to 7-10 times.
- Arms lift sideways, up and down – 5 times, increase to 7-10 times.
- Arms lift forwards, part and together – 5 times increase to 7-10 times.
- Fingers on the shoulder with elbows bent:
  - Elbows circling forwards, upwards, backwards & downwards – 5 times increased to 7–10 times.
  - Elbows circling backwards, upwards, forwards & downwards – 5 times increase 7-10 times.
- Shoulders bracing – 5 times, increase to 7–10 times.
- Right hand meeting left hand at the back (Right hand to be carried above the right shoulder, left hand carried from left side at the back and try to touch the right hand) Repeat the left hand carried above the left shoulder and the right hand turned in, carried from the side of trunk -3 times each side, increase to 5-7 times.

Instructions:

- Do not getting look down to read (or do any other work). Bring the reading materials to the eye level.
- All neck movements can be performed with practice, by using trunk movements.
- Use a low level pillow supporting the head and neck; pillow line upto the shoulders level. Otherwise not to be encouraged.
➢ While lying on sides, head should be in neutral position. Use one pillow and your hand to adjust the head, or in addition, one small pillow to adjust the head. Place one pillow in front to support the right arm if you are lying on right side, place a pillow to support your left arm.

**Prevention:**

1. Avoid sitting in cramped position.
2. Sleep without pillows.
3. Use a soft fabric collar or towel to support the neck.
4. Avoid injury.
5. Wear protective headgear for contact sports.
6. Use seat belts in vehicles and.
7. Keep head rests at proper height.

**Prognosis:**

The assessment of prognosis is attained by studying the pathological condition of the spinal cord and nerve roots. Improvement can be felt with some of the reversible changes with drug treatment. In complicated cases improvement is not possible. The signs and symptoms due to myelopathy are unmanageable. Long history of suffering multiple disc lesions and in severe compression of spinal cord may adversely affect the prognosis.
COMPARATIVE STUDY OF CEGANA VATHAM WITH CERVICAL SPONDYLOSIS

The author had followed YUGI-CHINTHAMANI -800 to evaluate the disease Ceganavatham.

"úLð úU Lì j ¾ú iZú Wðá úÚí e

"úLð úU Lì j ¾ú iZú Wðá úÚí m"

The above line said pain over the lower half of the cervical vertebrae. In human body have seven cervical vertebrae are present, of which lower half cervical vertebrae are (C4, C5, C6, C7) more commonly affected. Yugi stresses this matter in the above lines. In TV Sambasivam Pillai Ceganam refers to Cervical Vertebrae. In Yoogi Ceganam refers to Cervical, Thoracic and Lumbar Vertebrae.

"úL¾W ôj LWÁ W á Á LúY úSôkç "

These lines explain the radiating pain towards both upper limbs. There are eight pairs of cervical nerves having both dorsal and ventral nerve roots. These nerve roots comes through the intervertebral foramen. In cervical spondylosis, there is a narrowing of inter vertebral foramen due to abnormal osteophytes and ligament calcification. These pathological changes compress the nerve root resulting in neurological dysfunction and radiating pain in the distribution of nerve plexus.

"Yôð úU N-WùUp Xôm L] j ¾á dá m"
Because of the neural sheath compression and neurological dysfunction there is gradual sensory loss in the form of numbness. Neurological examination of these cervical spondylosis patients commonly shows paresthesia in the affected dermatomes. This is explained by the above line.

C5  - Paresthesia is perceived down the lateral aspect of the arm.
C6  - Paresthesia and hyperesthesia of thumb and some of index finger.
C7  - Paresthesia and hyperesthesia of index and middle fingers.
C8  - Paresthesia and hyperesthesia of inner forearm and little finger.

“Υ ðÃ Τì δά Υ\\\ e Lì æ U V d\\\ L U ðá m.”

When the cervical vertebral artery is compressed by the osteophytes of cervical vertebrae, the blood supply to the brain is decreased. Vertebro-basilar insufficiency and cervical instability causes giddiness in Cegana Vatham.

“Hð úU Á W á Lì æ ùUĂf Nì i Pôm”

Tharpagam situated in head and cools the eyes. kabam also gets along with uyirthathus there is derangement of course of disease. In Cegana Vatham the derangement of Tharpagam, burning sensation of eyes is present.

“Ht\s\ U\s\ n\ U X k R\s\ò\s\ m C ŋ , d L òæ m”
In Cegana Vatham Abana Vayu is affected. Abana vayu is centered in the lower abdomen. It governs all downward discharge of feces, Urine, semen, menstrual fluid and fetus. Due to derangement of abanan, constipation is present or improper excretion takes place.

“ūRō ūU ūLōhY ċ ūTōt Lādām”

Patient is unable to move his neck. There is muscular spasm in the early stage resulting in pain and neck rigidity. Ligamental calcification also results in neck stiffness. Because of the spasm and neck stiffness, there is pain in the neck region which resembles scorpion bite.
MATERIALS AND METHODS

The Clinical study on Sagana Vadham was carried out in the post graduate department of Sirappu Maruthuvam, Govt Siddha Medical College, Palayamkottai. In this study 20 patients were treated as in patients and the other 20 as outpatients. After discharge the patients were also followed as out patients.

Selection of the Patients:

The Patients were selected on the basis of the following clinical findings.

1. Pain, Stiffness and restricted movements in the neck
2. Radiating pain in the upper limbs
3. Tingling sensation and numbness in the upper limbs
4. Feeling of heaviness in the body and weakness of the limbs
5. Giddiness
6. Constipation
7. Mental depression
8. Burning sensation of eyes

The detailed history was taken from the patient about:

1. Occupation
2. Social economic status
3. Psychological condition
4. Diet and other habits
5. Trauma
6. Exposure to cold.
Diagnosis:

The diagnosis was made by following siddha diagnostic methods. Nilam, Kaalam, Poriyalaridhal, Pulanalarithal, Vinaadhal, Mukkutra Nilaigal, Udal Thathukal Nilai and Envagai Thervugal, and the diagnosis of Cegana Vadham was obtained which correlates with modern term cervical Spondylosis by the X-Ray findings.

Investigation:

The following investigations were done in all selected patients in the laboratory of Govt.Siddha Medical College, Palayamkottai.

Blood:

- Total WBC Count
- Differential WBC count
- Erythrocyte Sedimentation Rate
- Haemoglobin estimation
- Estimation of Sugar
- Estimation of Urea
- Estimation of Cholesterol.

Urine:

- Albumin
- Sugar
- Deposits
Radiological Investigations:

- X – Ray cervical spine
- AP – View
- Lateral View
- Oblique View

Treatment

Nilavagai Choornam 5gm at bedtime with hot water was given on the first day of treatment.

All the patients were treated with the following medicines

1. **Kadukkai Choornam**

   1gm twice daily with butter milk or honey.

2. **Yearanda Thylam**

   As external application

   All the patients were advised to dietary regimen (or) Pathiyam to avoid tamarind and salt

   Pranayamam and simple Yogasana were advised for a supportive therapy.

The Bio - Chemical analysis was done in the department of Bio Chemistry and Pharmacological analysis was done in the pharmacological laboratory of Govt. Siddha Medical College, Palayamkottai.
RESULTS AND OBSERVATION

Results of the study were observed with respect to the following criteria

1. Sex Distribution
2. Age Distribution
3. Paruva Kaalam (Seasonal Changes)
4. Gunam (Quality & characters)
5. Thinai (5 land types)
6. Duration of illness
7. Number of days treated
8. Socio economic status
9. Precipitating factors
10. Predisposing factors
11. Occupational status
12. Clinical Features
13. Provocative test
14. Mode of onset
15. Derangement of Thriodosha
16. State of Udal kattugal
17. Envagai Thervugal
18. Neikuri
19. Radiological findings.
20. Assessment of curative effect of the trial drug.

</table>

The incidence of this disease Cegana vatham among 20 In patients cases fifteen cases female (75%) and five cases are male 25%

Distribution According to Age

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Age in years</th>
<th>Total of Number Cases</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>31-40</td>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>2</td>
<td>41-50</td>
<td>7</td>
<td>35</td>
</tr>
<tr>
<td>3</td>
<td>51-60</td>
<td>6</td>
<td>30</td>
</tr>
<tr>
<td>4</td>
<td>61-70</td>
<td>6</td>
<td>30</td>
</tr>
<tr>
<td>5</td>
<td>71-80</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Among the cases for analysis the highest incidence was in the age between 41 to 50 (35%).

Distribution According to Predisposing Factors

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Predisposing factors</th>
<th>No. of Cases</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diabetes mellitus</td>
<td>2</td>
<td>10%</td>
</tr>
<tr>
<td>2</td>
<td>Hyper tension</td>
<td>1</td>
<td>5%</td>
</tr>
<tr>
<td>3</td>
<td>Tuberculosis</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>4</td>
<td>Radiotherapy</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Some authors suggest that the history or past history of few disorders were predisposing factors for Cegana vatham. Hence Diabetes,
Hypertension, Tuberculosis, Radiotherapy were noted in all 20 cases. Among them 2 patients (10%) were diabetic 1 patients (5%) were hypertensive.

**Distribution according to the duration of illness**

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Duration of illness (Months)</th>

<td>13</td>
<td>65</td>
</tr>
<tr>
<td>3</td>
<td>Thamogunam</td>
<td>5</td>
<td>25</td>
</tr>
</tbody>
</table>

Patients with Rajogunam (65%) were highly affected by Cegana vatham, 25% of them with Thamogunam.

**Distribution based on Etiological factors.**

Ageing was the common etiological factors for all 19 out of 20 cases. Apart from that other precipitating factors for all these twenty
cases were analysed and noted 20 cases (100%) had positive occupational history.

**Incidence based on occupation**

To find out and give clear data about the occupational hazards in cegana vatham patients, the nature of all the twenty patient’s occupations were thoroughly investigated and was given in the table. Among them 35% (7 patients) of them were Beedi rolling workers.

<table>

<tr>
<td>4</td>
<td>&gt;30</td>
<td>4</td>
<td>20</td>
</tr>
</tbody>
</table>

Among the 20 cases, 80 % even treated for 16 to 30 days.

**Observation of other Clinical Laboratory Examination**

At the time of admission and discharge routine laboratory examination were done and values were recorded.

**Haematological Studies**

Among the 20 patients 11 of them were anaemic. Blood sugar increased in 2 cases (10%). Cholesterol increased in 7 cases.

**WBC Count**

Total Count is between 7,800 to 10,200. In few cases the lymphocyte and neutrophil were little higher.
**Erythrocyte Sedimentation rate**

At the time of admission in few cases increased ESR was during discharge it was reduced.

**Urine Analysis**

Urine Sugar reported in 2 cases as they were known diabetic. They were treated with Mathumega Chooranam in addition to trial drug.

**Assessment of Radiological Findings**

DISCUSSION

This retrospective review of the disease Cegana vatham begins from the correlation of cegana vatham with the signs and symptoms of the disease cervical spondylosis which is given clearly in the comparative study by the author. And then initial sorting of information among the data extracted for the analysis include age, sex, duration of presenting symptoms, predisposing or precipitating factors that provoked pain and their radiological findings.

The drugs used for this clinical trial are KADUKKAI CHOORNAM internally and YEARNDA THYLAM externally. The detailed discussion of this dissertation topic by the author is based on the results and observations.

Age distribution

This study shows highest incidence of Cegana vatham is above 50 years of age which was already explained by modern science that degeneration due to ageing is the important cause of Cervical spondylosis.

This information is bestowed by our Siddhars as the wordings,

"úY i P o l mTRôm Y V ç Ru É p Å ú Wk ç
Å î j Â Å p A l é úU î m TôúW"

The target sites affected in Cervical spondylosis are generally bones, muscles, nerves, hair, blood, urine, fat which are the components of appu and prithivi bhoothas (appu+prithivi=kabham-responsible for destruction). Hence these began to undergo degeneration above 50, years.

Apart from the view of degeneration, the age above 50 is the period of overwhelming mental and physical grief and despair due to many factors. This was reported in majority of the 20 cases.
Sex Distribution

Majority affected sex is female (75%). Common cause for this may be entrapping of calcium from body above fifty years of age and from history, their occupation may be one of the reasons for female dominance.

Living Lands (Thinai)

The incidence of Cegana vatham is highest in people from Marutha Nilam (100%).

Generally in marutha Nilam, all the three doshas are in physiological ratio. But for these 20 Patients, the occupation and age delimit the physiological ratio and hence responsible for the higher incidence of Cegana vatham.

Quality and Character (Gunam) Distribution

Most of the patients (75%) under this analysis bear rajo gunam which was confessed by interrogation.

Socio Economic Status

70% of the people reported the signs and symptoms of Cegana vatham were under the povertyline and this under poverty may indirectly responsible for the higher data through their occupation.

Seasonal Distribution

Muthuvenir Kaalam (16th June-15th Agu.) shows the highest incidence of 55% and next 15% cases are reported during Elavenir Kaalam (16th Apr-15th June) Koodhir Kaalam (16th Oct-15th Dec.). This may be caused by changes in our digestive power with the varying seasons.

Precipitating Factors

Already the author has explained that the ageing is the common cause for Cegana vatham. Apart from that, occupation is the major (100%) precipitating factor.
**Occupational References**

The major occupation among 20 cases is Beedi rolling workers which is estimated as 35% (7 cases), followed by agricultural labour which accounts 20% (4 cases). Only one patient (5%) had a history of clerical work, who reported the signs and symptoms of Cegana vatham. Constant posterior stretching by these three types of occupation is responsible for the symptoms.

Agricultural labourers and weight bearers are the victims of Cegana vatham. Saint Yugi muni remarked this as “TôWùUnRp” which is one of the causes of vatha disease. This is repeatedly remarked by the modern text book of Orthopaedics (author- Gulgarni) as Cervical spondylosis. That is common to workers who carry approximately 100 kg weight on their shoulders.

**Clinical Manifestations**

Pain in the nape of the neck and in upper limbs present in all 20 cases (100%). 50% of cases had constipation.

**Derangement in Vatham**

Viyanan, Samanan were affected in all the 20 cases (100%).

**Derangement in Pitham**

Sathagapitha was affected in all the 20 cases (100%).

**Derangement in Kabham**

Santhigam was affected in all 20 cases (100%).

**Eight Parameters in our System (Envagai thervugal):**

By sparisam, 100% of cases showed diffuse tenderness. Burning sensation of eyes was found in 3 cases (15%). At the time of admission 10 patients (50%) were reported to have constipation. It was treated by laxative medicine.
In urine examination by neerkuri and neikuri, in 6 patients (30%) oil spreads like snake and in 5 cases (25%) spreads like ring and in 9 patients (45%) spread like pearl.

**Pulse Reading (Naadi)**

It was noted in all 20 cases. Vatha pitham was observed in 60% of cases.

**Laboratory Investigation**

Urine (Albumin, Sugar, Deposit) and Blood (Total Count, Differential Count, ESR, Haemoglobin, Sugar, Urea, Serum Cholesterol) were done for all 20 cases.

Anaemia was found in 11 cases (55% cases). ESR was raised in 11 cases and after treatment it was reduced.

Out of the 20 In-Patients treated, 2 cases were found to have diabetes mellitus and 1 cases were found to be hypertensive.

These patients continued their oral anti-diabetic drugs Madhumega choorana-1gm and Thribala choorana -1gm thrice a day with luke warm water and anti-hypertensive drugs. Asai Chooranam and Venthamarai choorana each 1gm thrice a day with luke warm water as they were taking along with the trial drugs. Their blood sugar levels were monitored and blood pressure recordings were noted and kept control during the treatment.

**Radiographic Studies**

These studies shows narrowed inter vertebral space, presence of degenerative changes, osteophytes, osteolytic and sclerotic changes, osteoporotic changes and mal-alignment.

The trial drugs showed improvement in prognosis of the disease clinically rather in radiographic changes.
Treatment

The treatment was aimed to correct the deranged doshas and providing relief from symptoms. Before treatment, the patients were advised to take 10 ml of Vellai ennai with luke warm water during early morning in empty stomach for purgation. The patient was asked to take rest from internal medicine and other activities on that day.

The author treated the patients with trial drugs Kadukkai Chooranam 1 gram internally twice a day with butter milk or honey and Yearanda Thylam externally. During treatment, the patients were advised to follow diet restrictions. (Avoid tamarind, tubers etc) and advised to avoid pillows.

Sirappu Maruthuvam techniques applied in Cegana Vatham Patients:

a) Thokkanam(Massage)

Among the 20 cases, 10 cases were treated additionally by thokkanam with Yearanda Thylam once in three days regularly. The procedural photographic illustrations of the patients are given by the author. These 10 patients showed a positive quick response in all signs and symptoms when compared with other 10 cases.

b) Yogasanas

Few asana procedures were explained by the author for all the cases during their later days of treatment and advised to follow up regularly and asked to visit after a month. Few patients consulted the author and gave positive response for Asana therapy.

c) Exercises

Among 20 cases, 10 patients were selected and asked to do simple exercises. Among the 10 cases, 6 patients showed quick relief of pain when compared with patients, who were not advised for exercises.
d) Pranayama

The author advised all the 20 patients to do pranayama regularly in future.

Curative effect

On the basis of assessment of curative effect of the trial drugs, improvement was recorded in majority of cases (40%). Among that 15% had 6-12 months illness, 15% had 12-24 months illness, 10% had >24 months illness.

Clinical cure was observed in 25% of cases. Among them 5% had 1-3 months of illness, 5% had 3-6 months illness, 15% had >6 months illness.

Marked effect was assessed in 35% of patients consisting of 5% with 1-3 months duration of illness, 5% with 3-6 months illness and 10% with 6-12 months illness, 15% with >12 months.

Bio Chemical Analysis

Bio chemical analysis of the trial drug was done in the Department of Bio chemistry, Government Siddha Medical College, Palayamkottai.

Kadukkai Choornam

1. Ferrousiron
2. Tannic acid
3. Unsaturated compound
4. Reducing Sugar.

No toxic or side effects were clinically observed in any cases.

Pharmacological Analysis

Pharmacological studies done in Pharmacology Department of Government Siddha Medical College, Palayamkottai. The results were reported as follows,
**Internal Medicine**

Kadukkai Chooranam

- Significant Acute Anti Inflammatory effect.
- Significant Chronic Anti Inflammatory effect.
- Moderate Analgesic effect.

**External Medicine**

Yearanda Thylam has Significant Anti-inflammatory effect.
SUMMARY

Twenty cases with Cegana vatham were diagnosed clinically based on the saint Yugi 800 and admitted in the In Patient ward of Post Graduate Department of Sirappu Maruthuvam, Government Siddha Medical College and Hospital, Palayamkottai and treated with the trial medicine.

- Before starting the treatment, careful detailed history was carried out and recorded for the 20 selected cases.
- The various Siddha aspects of examination of the disease were carried out and data were recorded in the proforma.
- Laboratory diagnosis of Cegana vatham was done by modern methods of investigation.
- The trial medicine chosen for both internal and external treatment were Kadukkai chooranam 1gram twice a day for fifteen days as per the severity of the disease and Yearanda Thylam external application.
- During the period of treatment all the patients were put under pathiyam (A special dietary regimen)
- A periodical laboratory investigation was made for all the cases along with the radiological investigation.
- The observations made during the clinical study shows that the main internal drug Kadukkai chooranam is clinically effective.
Though there was appreciable clinical improvement, there was not much remarkable radiographic changes.

Along with medication, the patients were advised over their dietary habits and to practice yoga and simple exercises.

The advantage of the selected drugs were listed as,

- The drugs were found to be free from adverse effects.
- The raw materials were available in almost all season.
- And finally it is economic.

These merits were essential in promoting this drug in future globally.
CONCLUSION

All the twenty patients were treated for this dissertation work with Kadukkai Chooranam 1 gram twice a day with butter milk or honey and Yearanda Thylam externally.

The results were observed as,

- Improvement effect - 40%
- Clinical cure - 25%
- Marked effect - 35%

This result of the clinical trial illustrates the fruitful effect of the drugs. Hence these drugs and methodology of the treatment will become one of the milestones in treating Cegana Vatha patients in future.

PHYTO CHEMISTRY OF TRIAL DRUGS

INTERNAL DRUG

Internal drug Kadukkai Choornam consists of following constituents which bears few phyto chemicals as follows.

कठिकाबू

Synonyms : Amutham, Aruthake, Vanathurke.

Botanical Name : Terminalia Chebula.

Part Used : Fruit

Family : Combrataceae

Organoleptic Characters:

Taste - Tuvarppu
Enippu
Pulippu
Kaippu
Karppu

Potence - Veppam
Pirivu - Karppu

Therapeutic effect

“புராநாகர்ப் போற்றாம் பகிருமைக்கு
அழுத்தாம் புத்திய பகிருமை - புராநாகர்ப்
நீர் மறுந்து விச்சு வரல்பார்குறு விளக்கத்து
அழுத்தாம் நிறைந்து வெள்ளிய வாழ்வு.

- அக்கிதியார் குமார வாகனம்

Constituents

Tannin 45%, Fructose, Sucrose

Gallic acid, Eighteen Typical amino acid

Chebulinic acid, Phosphoric acid
**Action**

- Purgative - பெராப்பும் போக்குத்தி
- Laxative - மோயிக்குத்தி
- Stomachic - பி. சுமுகம் சுட்டி

**Synonyms**: Asai, Posanakudori, Prathi-viga.

**Botanical Name**: Cuminum cyminum.

**Part Used**: Seed

**Family**: Apiaceae

**Organoleptic Characters:**

- **Taste** - Karppu, Enippu
- **Potence** - Thatppam
- **Pirivu** - Enippu

**Therapeutic effect:**

“பில்லியேட் பெருகியல் தின்பன்று பூங்கையல்
சுமுகம் போக்குத்தி போக்குத்தி பூங்கையல்
பில்லியேட் தின்பன்று சுட்டி
பில்லியேட் சுட்டி சுட்டி”

- சிறந்தக் கேச்சாதகம்

**Constituents:**

- Fatty oil
- Resin
- Protein
- Essential oil
- Cumic aldehyde – 56%

**Action**

- Carminative - கிரிமியம் போக்குத்தி
- Stomachic - பி. சுமுகம் சுட்டி
- Stimulant - திகழ்வும் போக்குத்தி
Synonyms - Arukan, Santi, Sunti
Botanical Name - Zingiber officinale.
Part Used - Under ground Stem (Rhizome)
Family - Zingiberaceae

Organoleptic Characters:
- Taste - Karppu
- Potence - Veppam
- Pirivu - Karppu

Therapeutic effect

- Carminative
- Stomachic
- Stimulant
- Digestive

Constituents:
- Zingiberine
- Resin
- Starch
- K – oxalate

Action
- Carminative
- Stomachic
- Stimulant
- Digestive
Synonyms - Koliaruke, Athe, Ulavainase
Botanical Name - Piper Langum
Part Used - Fruit
Family - Piperaceae

Organoleptic Characters:

BIO – CHEMICAL ANALYSIS

BIO – CHEMICAL ANALYSIS OF KADUKKAICHOORANAM

PREPARATION OF THE EXTRACT

5gms of Kadukkai Choornam was weighed accurately and placed in a 250ml clean beaker. Then 50ml distilled water is added and dissolved well. Then it is boiled well for about 10 minutes. It was cooled and filtered in a 100ml volumetric flask and then it is made up to 100ml with distilled water. This fluid is taken for analysis.

**Test for amino acid:**
One or two drops of the extract is placed on a filter paper and dried it well. After drying, 1% ninhydrin is sprayed over the same and dried it well.

| No violet colour is formed. | Absence of amino acid. |

**Inference**

The given sample of “**KADUKKAICHOORANAM**” contains, Tannic acid, ferrous iron and unsaturated compound.
ANNEXURE - III

PHARMACOLOGICAL ANALYSIS

ANALGESIC ACTION OF KADUKKAI CHOORANAM

Introduction

According to Siddha medicine, the Kadukkai Chooranam is indicated for Vatha diseases. From this indication the drug might possess analgesic activity.

Aim

To study the analgesic effect of Kadukkai Chooranam on albino rats by Tail flick method.

Materials and Methods

Preparation of the test Drug

1 gram of Kadukkai Chooranam was suspended in 10ml of Hot water as suspending agent. This 1 ml contained 100mg of the test drug.

Equipment

Hot water bath

Procedure

Six Male Healthy albino rats (weighing 80-100gms) were used is three groups. The animals were allowed to free access to food and water until they brought for the experiment. The animals which showed the positive response to the stimulus within a given time were selected for the study.

After the selection of animals which were responding to stimulus within 2 seconds, they were divided into three groups, each group consisting of two rats.
The hot water was maintained at 55°C. The tip of the tail was immersed into the water bath and the time was noted when the rat flicked the tail. First group was given 1 ml of water and kept as control.

Second group was administered with paracetamol at a dose of 20 mg/100 g of body weight. Third group as given the dose of 20 mg/100 gm body weight of the animal. After the drug administration, the reaction time of each rat after half an hour and one hour were noted in each group (when a rat fails to flick the tail, it should not be continued beyond 8 seconds to avoid injury) and the average was calculated.

The results of control group, standard group and drug treated group were tabulated and compared

<table>

**Inference**

From the above tabulation it is noted that “Kadukkai Chooranam” has moderate analgesic action.
ACUTE ANTI - INFLAMMATORY STUDIES ON
KADUKKAI CHOORANAM

Aim
To evaluate the acute anti - inflammatory effect of “KADUKKAI CHOORANAM” by carragenin induced hindpaw oedema method in Albino rats.

Materials and Methods

Drug Preparation

1 gm of KADUKKAI CHOORANAM was suspended in 100ml of distilled water with gum acacia as suspending agent Carragenin Induced Hind Paw Method.

Six healthy albino rats of either sex weighing between 80 to 100gm were selected. The volume of each hind paw was measured by using the mercury - plethysmograph.

After the measurement of hind paw of all the rats they were divided into three groups containing two rats.

First group was kept as control by giving distilled water 1ml / 100gm by body weight. The second group was given Ibuprofen 20mg/100gm body weight and kept as standard. Third group was given test drug KADUKKAI CHOORANAM 20mg / 100gm body weight.

The drugs were administered orally. One hour after drug administration 0.1ml 1% (W/v) of carragenin suspension in water was injected in the plantar surface of Hindpaw of all rats.

All the animals thus given carragenin injection subcutaneously.
Three hour after carragenin injection, the hind paw volume was measured once again. From the differences in the initial and final hind paw volume, the degree of the inflammation was calculated by taking the volume in untreated control group as 100%. The percentage of inflammation of the other group was calculated.

**Results**

The details of the experimental results shown in the table Effect of KADUKKAI CHOORANAM

<table>
<thead>
<tr>
<th>Group</th>

**Inference**

The test drug “KADUKKAI CHOORANAM” has got significant acute anti-inflammatory effect when compared with the standard drug.
CHRONIC ANTI - INFLAMMATORY EFFECT OF KADUKKAI CHOORANAM

Aim

To evaluate the Chronic anti - inflammatory effect of KADUKKAI CHOORANAM in rats by cotton pellets granuloma method.

Materials and Method

Drug Preparation

1 gm of KADUKKAI CHOORANAM was suspended in 10ml of distilled water with gum acacia as suspending agent.

Cotton pellet Granuloma method

Procedure

Six healthy albino rats of either sex weighing between 80-100 gm were selected and divided into 3 groups each containing two rats.

In this procedure the drugs were given daily for 7 days. Before giving the drug cotton pellets each weighing 10mg were prepared and sterilized in an autoclave for about one hour under 15 pounds atmospheric pressure.

On the day of experiment, each rat was anesthetised with ether to implant 10mg of sterilized cotton pellet subcutaneously in the lower abdomen two on each side after making suitable incision and sutured carefully.
First group was kept as control group giving distilled water of 1ml/100gm of body weight. To the second group the standard drug Ibuprofen in a dose of 20mg/100gm body weight was given.

The third group of animals was given tested drug KADUKKAI CHOORANAM in a dose of 20mg/100gm of body weight.

On the 8th day of the experiment, all the rats were sacrificed and cotton pellets found to be surrounded by granulation tissue were removed and dried in hot air oven 55°C to 60°C

**Results**

The details of the experimental results shown in the table.

**Effect on KADUKKAI CHOORANAM**

</table>

**Inference**

The test drug KADUKKAI CHOORANAM has got Moderate chronic anti - inflammatory effect when compared with the standard drug.
ANTI - INFLAMMATORY STUDIES ON

YEARANDA THYLAM (External drug)

Procedure

Anti - inflammatory activity of Yearanda thylam was studied in healthy albino rats, weighing between 100 - 150 grams. For studying acute inflammation, rat hind - paw technique was used.

Six albino rats were selected and divided into two groups each containing three rats. To the first group distilled water was given and kept as control. Before the application of the drug, the hind - paw volume of all rats were measured. This was done by dipping the hind paw upto the tibio - dorsal junction in mercury plethysmography.

Subcutaneous injection of 0.1% of carragenin (W/v) in water was made into plantar surface of both the hind - paw of each rat. To the test group. Yearanda thylam was topically applied frequently over the inflammed surface in a thin layer. To the control group, no drug was applied over the inflammed surface. One and half hours after injection the hind paw volume was measured once again. The difference between the initial and final volumes would show the amount of inflammation.

Taking the volume in the control group as 100% of inflammation, the inflammation or anti - inflammatory effect of the group is calculated
Tabulation of the results observed
